

# DA14582

## Low Power Bluetooth Smart SoC with Audio Codec

DA14582

### General description

The DA14582 integrated circuit has a fully integrated radio transceiver, baseband processor for *Bluetooth® Smart* with Audio Codec.

The DA14582 is optimized for remote control units (RCU) requiring support for voice commands and motion/gesture recognition. Its integrated analog wide band audio codec provides native support for analog microphones thereby reducing the total number of components of the system while its optimized package enables designs using single-layer FR1 PCBs further contributing to the reduction of the cost of the system.

The DA14582 supports a flexible memory architecture for storing Bluetooth profiles and custom application code, which can be updated over the air (OTA). The qualified Bluetooth Smart protocol stack is stored in a dedicated ROM. All software runs on the ARM® Cortex-M0 processor via a simple scheduler.

The Bluetooth Smart firmware includes the L2CAP service layer protocols, Security Manager (SM), Attribute Protocol (ATT), the Generic Attribute Profile (GATT) and the Generic Access Profile (GAP). All profiles published by the Bluetooth SIG as well as custom profiles are supported.

The transceiver interfaces directly to the antenna and is fully compliant with the *Bluetooth 4.1* standard.

The DA14582 has dedicated hardware for the Link Layer implementation of *Bluetooth® Smart* and interface controllers for enhanced connectivity capabilities.

### Features

- Complies with *Bluetooth* V4.1, ETSI EN 300 328 and EN 300 440 Class 2 (Europe), FCC CFR47 Part 15 (US) and ARIB STD-T66 (Japan)
- Processing power

- 16 MHz 32 bit ARM Cortex-M0 with SWD I/F
- Dedicated Link Layer Processor
- AES-128 bit encryption Processor
- Memories
  - 32 kB One-Time-Programmable (OTP) memory
  - 42 kB System SRAM
  - 84 kB ROM
  - 8 kB Retention SRAM
- Power management
  - Integrated Buck DC-DC converter
  - P0, P1, P2 and P3 ports with 3.3 V tolerance
  - Easy decoupling of only 4 supply pins
  - Supports coin (typ. 3.0 V) and alkaline (typ. 1.5 V) battery cells
  - 10-bit ADC for battery voltage measurement
- Digital controlled oscillators
  - 16 MHz crystal ( $\pm 20$  ppm max) and RC oscillator
  - 32 kHz crystal ( $\pm 50$  ppm,  $\pm 500$  ppm max) and RCX oscillator
- General purpose, Capture and Sleep timers
- Digital interfaces
  - 29 General purpose I/Os
  - 2 UARTs with hardware flow control up to 1 MBd
  - SPI+™ interface
  - I2C bus at 100 kHz, 400 kHz
  - 3-axis capable Quadrature Decoder
- Analog interfaces
  - 4-channel 10-bit ADC
  - 14 bits wide band Codec with microphone and 28  $\Omega$  loudspeaker analog front-end
- Radio transceiver
  - Fully integrated 2.4 GHz CMOS transceiver
  - Single wire antenna: no RF matching or RX/TX switching required
  - Supply current at VBAT3V: TX: 3.4 mA, RX: 3.7 mA (with ideal DC-DC)
  - 0 dBm transmit output power
  - -20 dBm output power in "Near Field Mode"
  - -93 dBm receiver sensitivity

<b>Debug interface</b>				
SW_DIO/P1_5	DIO	4.8	I-PU	INPUT/OUTPUT. JTAG Data input/output. Bidirectional data and control communication. Can also be used as a GPIO
SW_CLK/P1_4	DIO	4.8	I-PD	INPUT JTAG clock signal. Can also be used as a GPIO
<b>Clocks</b>				
XTAL16Mp	AI			INPUT. Crystal input for the 16 MHz XTAL
XTAL16Mm	AO			OUTPUT. Crystal output for the 16 MHz XTAL
XTAL32kp	AI			INPUT. Crystal input for the 32.768 kHz XTAL
XTAL32km	AO			OUTPUT. Crystal output for the 32.768 kHz XTAL

Table 2: Pin Description				
PIN NAME	TYPE	Drive (mA)	Reset state (Note)	DESCRIPTION
16MCLK/P0_5	DIO	4.8		OUTPUT. Buffered 16MHz output This clock is used as reference clock for the on-chip Codec which is enabled via a test register bit 0x500030F0[0]=1. However, when enabled the following pins also output certain clock signals. In this case these port pins can only be used as general purpose inputs by setting Pxy_MODE_REG[PID]=0 and Pxy_MODE_REG[PUPD] unequal to 3: P0_6: XTAL32K P0_7: RC16M P1_0: RC32K P1_1: RC32K_low_jitter
<b>SPI bus interface (Refer to Table 3 for the fixed SPI pin assignment during codec operation)</b>				
SPI_CLK	DO			INPUT/OUTPUT. SPI Clock. Mapped on Px ports.
SPI_DI	DI			INPUT. SPI Data input. Mapped on Px ports.
SPI_DO	DO			OUTPUT. SPI Data output. Mapped on Px ports
SPI_EN	DI/DO			INPUT/OUTPUT. SPI Clock enable. Mapped on Px ports
<b>I2C bus interface</b>				
SDA	DIO/DIOD			INPUT/OUTPUT. I2C bus Data with open drain port. Mapped on Px ports
SCL	DIO/DIOD			INPUT/OUTPUT. I2C bus Clock with open drain port. In open drain mode, SCL is monitored to support bit stretching by a slave. Mapped on Px ports.
<b>UART interface</b>				
UTX	DO			OUTPUT. UART transmit data. Mapped on Px ports
URX	DI			INPUT. UART receive data. Mapped on Px ports
URTS	DO			OUTPUT. UART Request to Send. Mapped on Px ports
UCTS	DI			INPUT. UART Clear to Send. Mapped on Px ports
UTX2	DO			OUTPUT. UART 2 transmit data. Mapped on Px ports
URX2	DI			INPUT. UART 2 receive data. Mapped on Px ports
URTS2	DO			OUTPUT. UART 2 Request to Send. Mapped on Px ports
UCTS2	DI			INPUT. UART 2 Clear to Send. Mapped on Px ports
<b>Analog interface</b>				
ADC[0]	AI			INPUT. Analog to Digital Converter input 0. Mapped on P0[0]
ADC[1]	AI			INPUT. Analog to Digital Converter input 1. Mapped on P0[1]
ADC[2]	AI			INPUT. Analog to Digital Converter input 2. Mapped on P0[2]
ADC[3]	AI			INPUT. Analog to Digital Converter input 3. Mapped on P0[3]
<b>Codec interface</b>				
GPIO2, GPIO3	DIO	8	I-PU	INPUT/OUTPUT. Codec General Purpose I/O ports with selectable pull up/down resistor. Supplied from VDDIO
RSTn	DI			INPUT. Codec reset signal (active low). After startup this pin must be kept LOW for at least 1 us (while the clock is active) to guarantee synchronous release of the reset.
VREFp	A1	-	Hi-Z	OUTPUT. Positive microphone reference voltage.
VREFm	A1	-	-	Ground for Codec AFE reference voltages and microphone. Must be connected to star-point of common ground.
LSRp, LSRn	A1	-	Hi-Z	OUTPUT. Loudspeaker earpiece outputs positive and negative.

Table 2: Pin Description				
PIN NAME	TYPE	Drive (mA)	Reset state (Note)	DESCRIPTION
MICp, MICn	A2	-	I	INPUT. Microphone inputs positive and negative.
VBUF	A1	-	Hi-Z	AFE Voltage reference 1.5 V output. Must be decoupled with a 100 nF capacitor
VDD	A1	-	-	INPUT. Digital core supply voltage (1.8 V).
VDDIO	A1	-	-	INPUT. Supply voltage for all digital I/Os (up to 3.45 V).
VSS	A1	-	-	Digital core ground and digital I/O ground.
AVS	A1	-	-	Ground for Codec AFE main blocks.
<b>Radio transceiver</b>				
RFIOp	AIO			RF input/output. Impedance 50 Ω.
RFIOm	AIO			RF ground
<b>Miscellaneous</b>				
RST	DI			INPUT. BLE reset signal (active HIGH). Must be connected to GND if not used.
VBAT_RF	AIO			Connect to VBAT3V on the PCB
VDCDC_RF	AIO			Connect to VDCDC on the PCB
VPP	AI			INPUT. This pin is used while OTP programming and testing. OTP programming: VPP = 6.8 V ± 0.25 V OTP Normal operation: leave VPP floating
<b>Power supply</b>				
VBAT3V	AIO			INPUT/OUTPUT. Battery connection. Used for a single coin battery (3 V). If an alkaline or a NiMH battery (1.5 V) is attached to pin VBAT1V, this is the second output of the DC-DC converter.
VBAT1V	AI			INPUT. Battery connection. Used for an alkaline or a NiMH battery (1.5 V). If a single coin battery (3 V) is attached to pin VBAT3V, this pin must be connected to GND.
SWITCH	AIO			INPUT/OUTPUT. Connection for the external DC-DC converter inductor.
VDCDC	AO			Output of the DC-DC converter
GND	AIO	-	-	Ground

### 3. System overview

The DA14582 contains the following internal blocks:

#### 3.1 ARM CORTEX-M0 CPU

The Cortex-M0 processor is a 32-bit Reduced Instruction Set Computing (RISC) processor with a von Neumann architecture (single bus interface). It uses an instruction set called Thumb, which was first supported in the ARM7TDMI processor; however, several newer instructions from the ARMv6 architecture and a few instructions from the Thumb-2 technology are also included. Thumb-2 technology extended the previous Thumb instruction set to allow all operations to be carried out in one CPU state. The instruction set in Thumb-2 includes both 16-bit and 32-bit instructions; most instructions generated by the C compiler use the 16-bit instructions, and the 32-bit instructions are used when the 16-bit version cannot carry out the required operations. This results in high code density and avoids the overhead of switching between two instruction sets.

In total, the Cortex-M0 processor supports only 56 base instructions, although some instructions can have more than one form. Although the instruction set is small, the Cortex-M0 processor is highly capable because the Thumb instruction set is highly optimized.

Academically, the Cortex-M0 processor is classified as load-store architecture, as it has separate instructions for reading and writing to memory, and instructions for arithmetic or logical operations that use registers.

#### Features

- Thumb instruction set. Highly efficient, high code density and able to execute all Thumb instructions from the ARM7TDMI processor.
- High performance. Up to 0.9 DMIPS/MHz (Dhrystone 2.1) with fast multiplier.
- Built-in Nested Vectored Interrupt Controller (NVIC). This makes interrupt configuration and coding of exception handlers easy. When an interrupt request is taken, the corresponding interrupt handler is executed automatically without the need to determine the exception vector in software.
- Interrupts can have four different programmable priority levels. The NVIC automatically handles nested interrupts.
- The design is configured to respond to exceptions (e.g. interrupts) as soon as possible (minimum 16 clock cycles).
- Non maskable interrupt (NMI) input for safety critical systems.
- Easy to use and C friendly. There are only two modes (Thread mode and Handler mode). The whole application, including exception handlers, can be written in C without any assembler.
- Built-in System Tick timer for OS support. A 24-bit timer with a dedicated exception type is included in

the architecture, which the OS can use as a tick timer or as a general timer in other applications without an OS.

- SuperVisor Call (SVC) instruction with a dedicated SVC exception and PendSV (Pendable SuperVisor service) to support various operations in an embedded OS.
- Architecturally defined sleep modes and instructions to enter sleep. The sleep features allow power consumption to be reduced dramatically. Defining sleep modes as an architectural feature makes porting of software easier because sleep is entered by a specific instruction rather than implementation defined control registers.
- Fault handling exception to catch various sources of errors in the system.
- Support for 24 interrupts.
- Little endian memory support.
- Wake up Interrupt Controller (WIC) to allow the processor to be powered down during sleep, while still allowing interrupt sources to wake up the system.
- Halt mode debug. Allows the processor activity to stop completely so that register values can be accessed and modified. No overhead in code size and stack memory size.
- CoreSight technology. Allows memories and peripherals to be accessed from the debugger without halting the processor.
- Supports Serial Wire Debug (SWD) connections. The serial wire debug protocol can handle the same debug features as the JTAG, but it only requires two wires and is already supported by a number of debug solutions from various tools vendors.
- Four (4) hardware breakpoints and two (2) watch points.
- Breakpoint instruction support for an unlimited number of software breakpoints.
- Programmer's model similar to the ARM7TDMI processor. Most existing Thumb code for the ARM7TDMI processor can be reused. This also makes it easy for ARM7TDMI users, as there is no need to learn a new instruction set.

#### 3.2 BLUETOOTH SMART

##### 3.2.1 BLE Core

The BLE (Bluetooth Low Energy) core is a qualified Bluetooth baseband controller compatible with the Bluetooth Smart specification and it is in charge of packet encoding/decoding and frame scheduling.

#### Features

- All device classes support (Broadcaster, Central, Observer, Peripheral)

- All packet types (Advertising / Data / Control)
- Encryption (AES / CCM)
- Bit stream processing (CRC, Whitening)
- FDMA/TDMA/events formatting and synchronization
- Frequency hopping calculation
- Operating clock 16 MHz or 8 MHz
- Low power modes supporting 32.0 kHz or 32.768 kHz
- Supports power down of the baseband during the protocol's idle periods
- AHB Slave interface for register file access
- AHB Slave interface for Exchange Memory access of CPU via BLE core
- AHB Master interface for direct access of BLE core to Exchange Memory space

### 3.2.2 Radio Transceiver

The Radio Transceiver implements the RF part of the Bluetooth Smart protocol. Together with the Bluetooth 4.0 PHY layer, this provides a 93 dB RF link budget for reliable wireless communication.

All RF blocks are supplied by on-chip low-drop out-regulators (LDOs). The bias scheme is programmable per block and optimized for minimum power consumption.

The Bluetooth LE radio comprises the Receiver, Transmitter, Synthesizer, Rx/Tx combiner block, and Biasing LDOs.

#### Features

- Single ended RFIO interface, 50  $\Omega$  matched
- Alignment free operation
- -93 dBm receiver sensitivity
- 0 dBm transmit output power
- Ultra low power consumption
- Fast frequency tuning minimises overhead

### 3.2.3 SmartSnippets™

The DA14582 comes complete with Dialog's SmartSnippets™ Bluetooth Software platform which includes a qualified Bluetooth Smart single-mode stack on chip. Numerous Bluetooth Smart profiles for consumer wellness, sport, fitness, security and proximity applications are supplied as standard, while additional customer profiles can be developed and added as needed.

The SmartSnippets™ software development environment is based on Keil™'s uVision mature tools and contains example application code for both embedded and hosted modes.

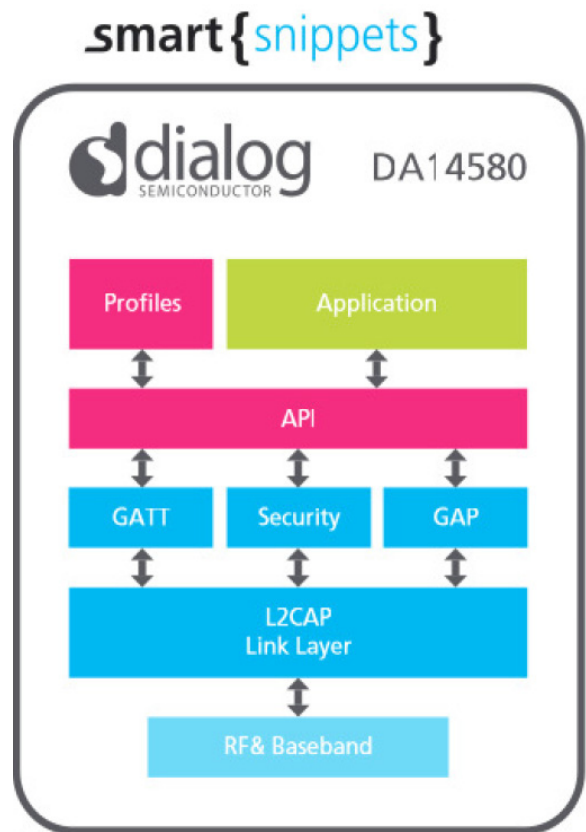

Figure 3 SmartSnippets stack

Apart from the protocol stack, the Software platform supports a Hardware Abstraction Layer (HAL) which enables easy access to peripheral's features from a programmer's point of view, as presented in the following figure.

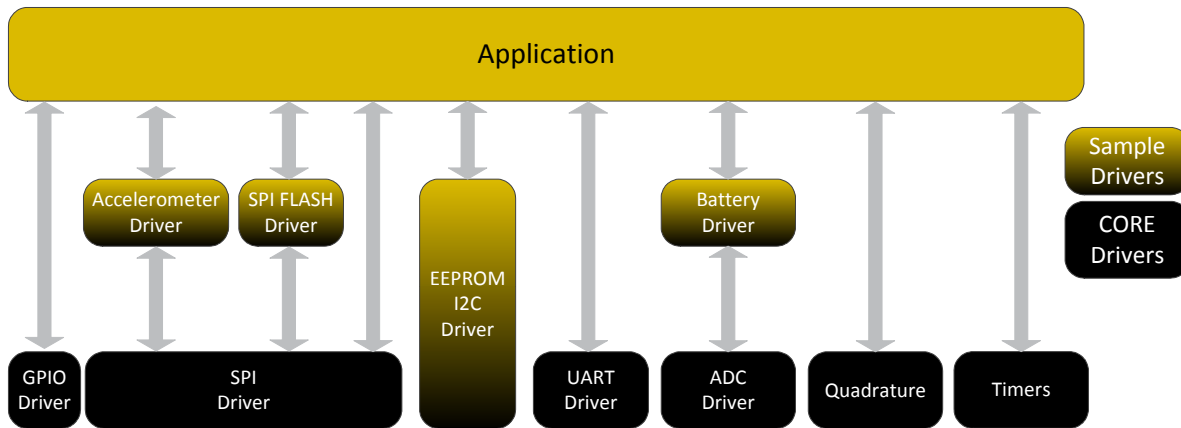

Figure 4 Hardware abstraction layer

Core drivers are provided for each interface of the DA14582 enabling optimized usage of the hardware's capabilities. These drivers provide an easy-to-use interface towards the hardware engines without having to interfere with the register programming directly.

On top of the core drivers, a number of sample drivers is also provided enabling communication with basic Bluetooth Smart application components: accelerometers, FLASH/EEPROM non-volatile memories, etc.

### 3.3 MEMORIES

The following memories are part of the DA14582's internal blocks:

**ROM.** This is a 84 kB ROM containing the Bluetooth Smart protocol stack as well as the boot code sequence.

**OTP.** This is a 32 kB One-Time Programmable memory array, used to store the application code as well as Bluetooth Smart profiles. It also contains the system configuration and calibration data.

**System SRAM.** This is a 42 kB system SRAM (Sys-RAM) which is primarily used for mirroring the program code from the OTP when the system wakes/powers up. It also serves as Data RAM for intermediate variables and various data that the protocol requires. Optionally, it can be used as extra memory space for the BLE TX and RX data structures.

**Retention RAMs.** These are 4 special low leakage SRAM cells (2 kB + 2 kB + 3 kB + 1 kB) used to store various data of the Bluetooth Smart protocol as well as the system's global variables and processor stack when the system goes into Deep Sleep mode. Storage of this data ensures secure and quick configuration of the BLE Core after the system wakes up. Every cell can be powered on or off according to the application needs for retention area when in Deep Sleep mode.

**Codec.** A bidirectional 14 bits Sigma-delta codec with full differential analog front-end for microphones and loudspeakers down-to 28 ohm is connected internally via SPI to the BLE core.

### 3.4 FUNCTIONAL MODES

The DA14582 is optimized for deeply embedded applications such as health monitoring, sports measuring, human interaction devices etc. Customers are able to develop and test their own applications. Upon completion of the development, the application code can be programmed into the OTP. In general, the system has three functional modes of operation:

**A. Development mode:** During this phase application code is developed using the ARM Cortex-M0 SW environment. The compiled code is then downloaded into the System RAM or any Retention RAMs by means of SWD (JTAG) or any serial interface (e.g. UART). Address 0x00 is remapped to the physical memory that contains the code and the CPU is configured to reset and execute code from the remapped device. This mode is enabling application development, debugging and on-the-fly testing.

**B. Normal mode:** After the application is ready and verified, the code can be burned into the OTP. When the system boots/wakes up, the DMA of the OTP controller will automatically copy the program code from the OTP into the system RAM. Next, a SW reset or a jump to the System RAM occurs and code execution is started. Hence, in this mode, the system is autonomous, contains the required SW in OTP and is ready for integration into the final product.

**C. Calibration mode:** Between Development and Normal mode, there is an intermediate stage where the chip needs to be calibrated with respect to two important features:

- Programming of the Bluetooth device address
- Programming of the trimming value for the external 16 MHz crystal.

This mode of operation applies to the final product and is performed by the customer. During this phase, certain fields in the OTP should be programmed

### 3.5 POWER MODES

There are four different power modes in the DA14582:

- *Active mode*: System is active and operates at full speed.
- *Sleep mode*: No power gating has been programmed, the ARM CPU is idle, waiting for an interrupt. PD\_SYS is on. PD\_PER and PED\_RAD depending on the programmed enabled value.
- *Extended Sleep mode*: All power domains are off except for the PD\_AON, the programmed PD\_RR<sub>x</sub> and the PD\_SR. Since the SysRAM retains its data, no OTP mirroring is required upon waking up the system.
- *Deep Sleep mode*: All power domains are off except for the PD\_AON and the programmed PD\_RR<sub>x</sub>. This mode dissipates the minimum leakage power. However, since the SysRAM has not retained its data, an OTP mirror action is required upon waking up the system.

### 3.6 INTERFACES

#### 3.6.1 UARTs

The UART is compliant to the industry-standard 16550 and is used for serial communication with a peripheral, modem (data carrier equipment, DCE) or data set. Data is written from a master (CPU) over the APB bus to the UART and it is converted to serial form and transmitted to the destination device. Serial data is also received by the UART and stored for the master (CPU) to read back.

There is no DMA support on the UART block since its contains internal FIFOs. Both UARTs support hardware flow control signals (RTS, CTS, DTR, DSR).

#### Features

- 16 bytes Transmit and receive FIFOs
- Hardware flow control support (CTS/RTS)
- Shadow registers to reduce software overhead and also include a software programmable reset
- Transmitter Holding Register Empty (THRE) interrupt mode
- IrDA 1.0 SIR mode supporting low power mode.
- Functionality based on the 16550 industry standard:
- Programmable character properties, such as number of data bits per character (5-8), optional

- parity bit (with odd or even select) and number of stop bits (1, 1.5 or 2)
- Line break generation and detection
- Prioritized interrupt identification
- Programmable serial data baud rate as calculated by the following: baud rate = (serial clock frequency)/(divisor).

#### 3.6.2 SPI+

This interface supports a subset of the Serial Peripheral Interface SPI™. The serial interface can transmit and receive 8, 16 or 32 bits in master/slave mode and transmit 9 bits in master mode. The SPI + interface has enhanced functionality with bidirectional 2x16-bit word FIFOs.

SPI™ is a trademark of Motorola, Inc.

#### Features

- Slave and Master mode
- 8 bit, 9 bit, 16 bit or 32 bit operation
- Clock speeds upto 16 MHz for the SPI controller. Programmable output frequencies of SPI source clock divided by 1, 2, 4, 8
- SPI clock line speed up to 8 MHz
- SPI mode 0, 1, 2, 3 support (clock edge and phase)
- Programmable SPI\_DO idle level
- Maskable Interrupt generation
- Bus load reduction by unidirectional writes-only and reads-only modes.

Built-in RX/TX FIFOs for continuous SPI bursts.

#### 3.6.3 I2C interface

The I2C interface is a programmable control bus that provides support for the communications link between Integrated Circuits in a system. It is a simple two-wire bus with a software-defined protocol for system control, which is used in temperature sensors and voltage level translators to EEPROMs, general-purpose I/O, A/D and D/A converters.

#### Features

- Two-wire I2C serial interface consists of a serial data line (SDA) and a serial clock (SCL)
- Two speeds are supported:
- Standard mode (0 to 100 kbit/s)
- Fast mode (<= 400 kbit/s)
- Clock synchronization
- 32 deep transmit/receive FIFOs
- Master transmit, Master receive operation
- 7 or 10-bit addressing

- 7 or 10-bit combined format transfers
- Bulk transmit mode
- Default slave address of 0x055
- Interrupt or polled-mode operation
- Handles Bit and Byte waiting at both bus speeds
- Programmable SDA hold time

### 3.6.4 General purpose ADC

The DA14582 is equipped with a high-speed ultra low power 10-bit general purpose Analog-to-Digital Converter (GPADC). It can operate in unipolar (single ended) mode as well as in bipolar (differential) mode. The ADC has its own voltage regulator (LDO) of 1.2 V, which represents the full scale reference voltage.

#### Features

- 10-bit dynamic ADC with 65 ns conversion time
- Maximum sampling rate 3.3 Msample/s
- Ultra low power (5  $\mu$ A typical supply current at 100 ksamples/s)
- Single-ended as well as differential input with two input scales
- Four single-ended or two differential external input channels
- Battery monitoring function
- Chopper function
- Offset and zero scale adjust
- Common-mode input level adjust

### 3.6.5 Quadrature decoder

This block decodes the pulse trains from a rotary encoder to provide the step and the direction of the movement of an external device. Three axes (X, Y, Z) are supported.

The integrated quadrature decoder can automatically decode the signals for the X, Y and Z axes of a HID input device, reporting step count and direction: the channels are expected to provide a pulse train with 90 degrees phase difference; depending on whether the reference channel is leading or lagging, the direction can be determined.

This block can be used for waking up the chip as soon as there is any kind of movement from the external device connected to it.

#### Features

- Three 16-bit signed counters that provide the step count and direction on each of the axes (X, Y and Z)
- Programmable system clock sampling at maximum 16 MHz.

- APB interface for control and programming
- Programmable source from P0, P1 and P2 ports
- Digital filter on the channel inputs to avoid spikes

### 3.6.6 Keyboard controller

The Keyboard controller can be used for debouncing the incoming GPIO signals when implementing a keyboard scanning engine. It generates an interrupt to the CPU (KEYBR\_IRQ).

In parallel, five extra interrupt lines can be triggered by a state change on 32 selectable GPIOs (GPIOx\_IRQ).

#### Features

- Monitors any of the available GPIOs (Px\_y) excluding GPIO2 and GPIO3.
- Generates a keyboard interrupt on key press or key release
- Implements debouncing time from 0 upto 63 ms
- Supports five separate interrupt generation lines from GPIO toggling

### 3.6.7 Input/output ports

The DA14582 has software-configurable I/O pin assignment, organized into ports Port 0, Port1 and Port2.

#### Features

- Port 0: 8 pins, Port 1: 6 pins (including SW\_CLK and SWDIO), Port 2: 10 pins, Port 3: 5 pins
- Fully programmable pin assignment
- Selectable 25 k $\Omega$  pull-up, pull-down resistors per pin
- Pull-up voltage either VBAT3V (BUCK mode) or VBAT1V (BOOST mode) configurable per pin
- Fixed assignment for analog pin ADC[3:0]
- Pins retain their last state when system enters the Extended or Deep Sleep mode.

## 3.7 TIMERS

### 3.7.1 General purpose timers

The Timer block contains 2 timer modules that are software controlled, programmable and can be used for various tasks.

#### Timer 0

- 16-bit general purpose timer
- Ability to generate 2 Pulse Width Modulated signals (PWM0 and PWM1, with common programming)
- Programmable output frequency:

$$f = \frac{(16, 8, 4, 2 \text{ MHz or } 32 \text{ kHz})}{(M+1) + (N+1)}$$

with N = 0 to (2<sup>16</sup>-1), M = 0 to (2<sup>16</sup>-1)

- Programmable duty cycle:

$$\delta = \frac{M+1}{(M+1) + (N+1)} \times 100 \%$$

- Separately programmable interrupt timer:

$$T = \frac{(16, 8, 4, 2 \text{ MHz or } 32 \text{ kHz})}{(ON+1)}$$

### Timer 2

- 14-bit general purpose timer
- Ability to generate 3 Pulse Width Modulated signals (PWM2, PWM3 and PWM4)
- Input clock frequency:

$$f_{IN} = \frac{\text{sys\_clk}}{N} \text{ with } N = 1, 2, 4 \text{ or } 8$$

and sys\_clk = 16 MHz or 32 kHz

- Programmable output frequency:

$$f_{OUT} = \left(\frac{f_{IN}}{2}\right) \text{ to } \left(\frac{f_{IN}}{2^{14}-1}\right)$$

- Three outputs with Programmable duty cycle from 0 % to 100 %
- Used for white LED intensity (on/off) control

### 3.7.2 Wake-Up timer

The Wake-up timer can be programmed to wake up the DA14582 from power down mode after a pre-programmed number of GPIO events.

#### Features

- Monitors any GPIO state change
- Implements debouncing time from 0 upto 63 ms
- Accumulates external events and compares the number to a programmed value
- Generates an interrupt to the CPU

### 3.7.3 Watchdog timer

The Watchdog timer is an 8-bit timer with sign bit that can be used to detect an unexpected execution sequence caused by a software run-away and can generate a full system reset or a Non-Maskable Interrupt (NMI).

#### Features

- 8 bits down counter with sign bit, clocked with a 10.24 ms clock for a maximum 2.6 s time-out.
- Non-Maskable Interrupt (NMI) or WDOG reset.
- Optional automatic WDOG reset if NMI handler fails to update the Watchdog register.

- Non-maskable Watchdog freeze of the Cortex-M0 Debug module when the Cortex-M0 is halted in Debug state.

Maskable Watchdog freeze by user program. Note that if the system is not remapped, i.e. SysRAM is at address 0x20000000, then a watchdog fire will trigger the BootROM code to be executed again.

## 3.8 CLOCK/RESET

### 3.8.1 Clocks

The Digital Controlled Xtal Oscillator (DXCO) is a Pierce configured type of oscillator designed for low power consumption and high stability. There are two such crystal oscillators in the system, one at 16 MHz (XTAL16M) and a second at 32.768 kHz (XTAL32K). The 32.768 kHz oscillator has no trimming capabilities and is used as the clock of the Extended/Deep Sleep modes. The 16 MHz oscillator can be trimmed.

The principle schematic of the two oscillators is shown in Figure 5 below. No external components to the DA14582 are required other than the crystal itself. If the crystal has a case connection, it is advised to connect the case to ground.

Figure 5 Crystal oscillator circuits

There are 3 RC oscillators in the DA14582: one providing 16 MHz (RC16M), one providing 32 kHz (RC32K) and one providing a frequency in the range of 10.5 kHz (RCX).

### 3.8.2 Reset

The DA14582 comprises an RST pad which is active high. It contains an RC filter for spikes suppression with 400 kΩ and 2.8 pF for the resistor and the capacitor respectively. It also contains a 25 kΩ pull-down resistor. This pad should be connected to ground if not needed by the application. The typical latency of the

RST pad is in the range of 2  $\mu$ s.

### 3.9 POWER MANAGEMENT

The DA14582 has a complete power management function integrated with Buck or Boost DC-DC converter and separate LDOs for the different power domains of the system.

#### Features

- On-chip LDOs, without external capacitors
- Synchronous DC-DC converter which can be configured as either:
  - Boost (step-up) converter, starting from 0.9 V, when running from an Alkaline/NiMH cell.
  - Buck (step-down) converter for increased efficiency when running from a Lithium coin-cell or 2 Alkaline batteries down to 2.2 V.
- On/Off control
- Battery voltage measurement ADC (multiplexed input from general purpose ADC)
- Use of small external components (2.2  $\mu$ H inductor and 1  $\mu$ F capacitor)

The Power Block contains a DC-DC converter which can be configured to operate as a Step-Up or a Step-

Down converter. The converter provides power to four LDO groups in the system:

1. LDO RET: This is the LDO providing power to the Retention domain (PD\_AON). It powers the Retention RAMs and the digital part which is always on.
2. LDO OTP: This is the LDO powering the OTP macro cell. This is the reason for using the step-up DC-DC converter when running from an Alkaline battery.
3. LDO SYS: This is the LDO providing the system with the actual VDD power required for the digital part to operate. Note that the Power Block implements seamless switching from the LDO SYS to the LDO RET when the system enters Deep Sleep mode. In the latter case, a low voltage is applied to the PD\_AON power domain to further reduce leakage.
4. LDO (various): This a group of LDOs used for the elaborate control of the powering up/down of the Radio, the GP ADC and the XTAL16M oscillator.

There are two ways of connecting external batteries to the Power Block of the DA14582. They depend on the specific battery cell used and its voltage range. Battery cells are distinguished into Lithium coin cells (2.2 V to 3.3 V) and Alkaline cells (1.0 V to 1.8 V). The connection diagrams are presented in Figure 7 and Figure 6 respectively:

Figure 6 Supply overview, Coin-cell application

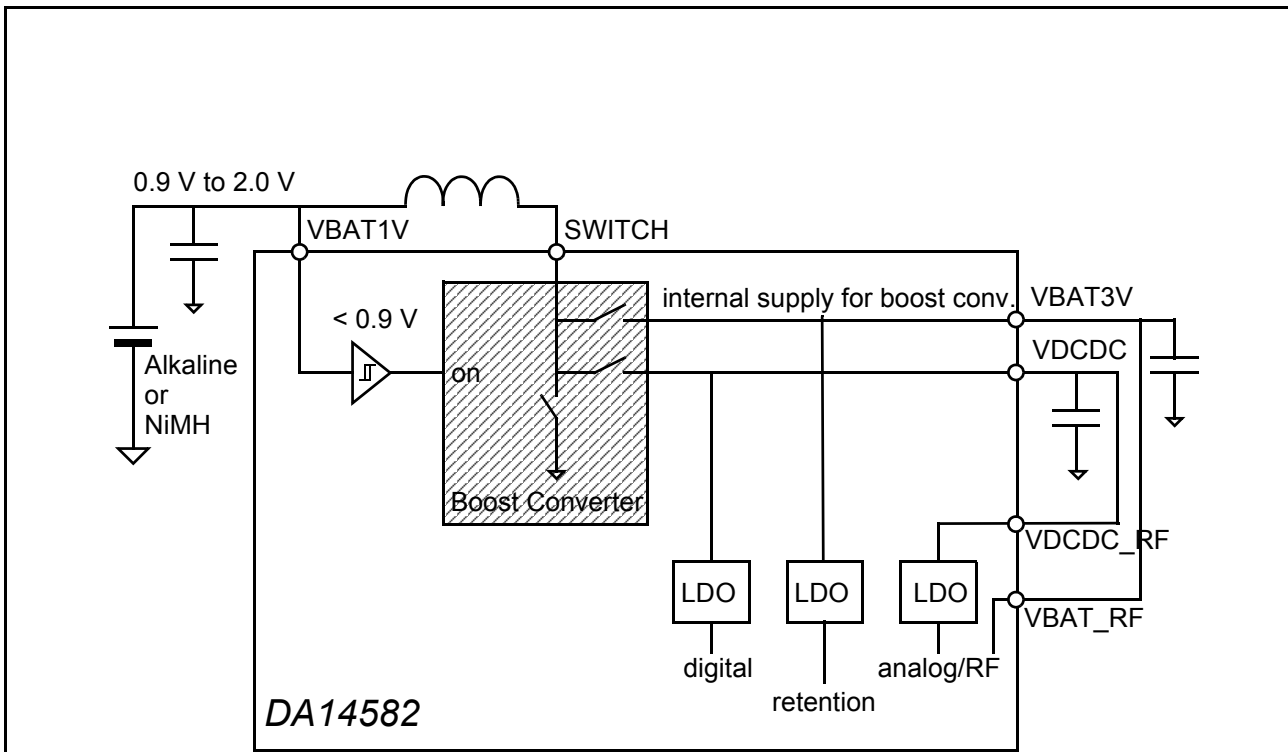

Figure 7 Supply overview, Alkaline-cell application

The usage of Boost or Buck mode with respect to the provided voltage ranges is illustrated in the following figure which also illustrates the efficiency of the engine assuming a 10 mA constant load.

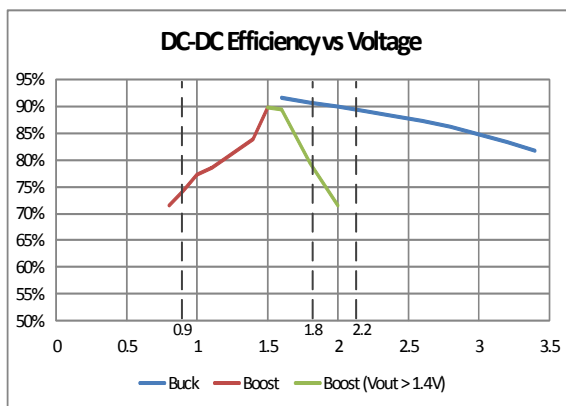

Figure 8 DC-DC efficiency in Buck/Boost mode on various voltage levels

The X axis represents the supply voltage. BOOST mode should be used when voltage ranges from 0.9 V to 2.0 V to sustain a decent efficiency over 70 %. From that point on, the power dissipation becomes quite large.

BUCK mode can operate correctly with voltages in the

range of 1.5 V to 3.3 V.

There are two voltage areas in Figure 8 designated by dashed lines. The first one (0 V to 0.9 V) indicates that the DA14582 is not operational when the voltage is below 0.9 V. This is the absolute threshold for the DC-DC converter Boost mode.

The second area (1.8 V to 2.2 V) indicates that Deep Sleep mode is not allowed when the DC-DC converter is configured in BUCK mode and the voltage is within this range, because the OTP will not be readable any more. However, this part of the voltage range can be covered by the BOOST mode. Furthermore, when BUCK mode is mandatory, Extended Sleep mode can be activated instead of Deep Sleep mode, thus not using the OTP for the code mirroring but retain the code in SysRAM.

**Note:** The system should never be cold booted when the supply voltage is less than 2.5 V. A manual power up with a power supply less than 2.5 V in buck mode might create instability.

### 3.10 AUDIO CODEC WITH ANALOG FRONTEND

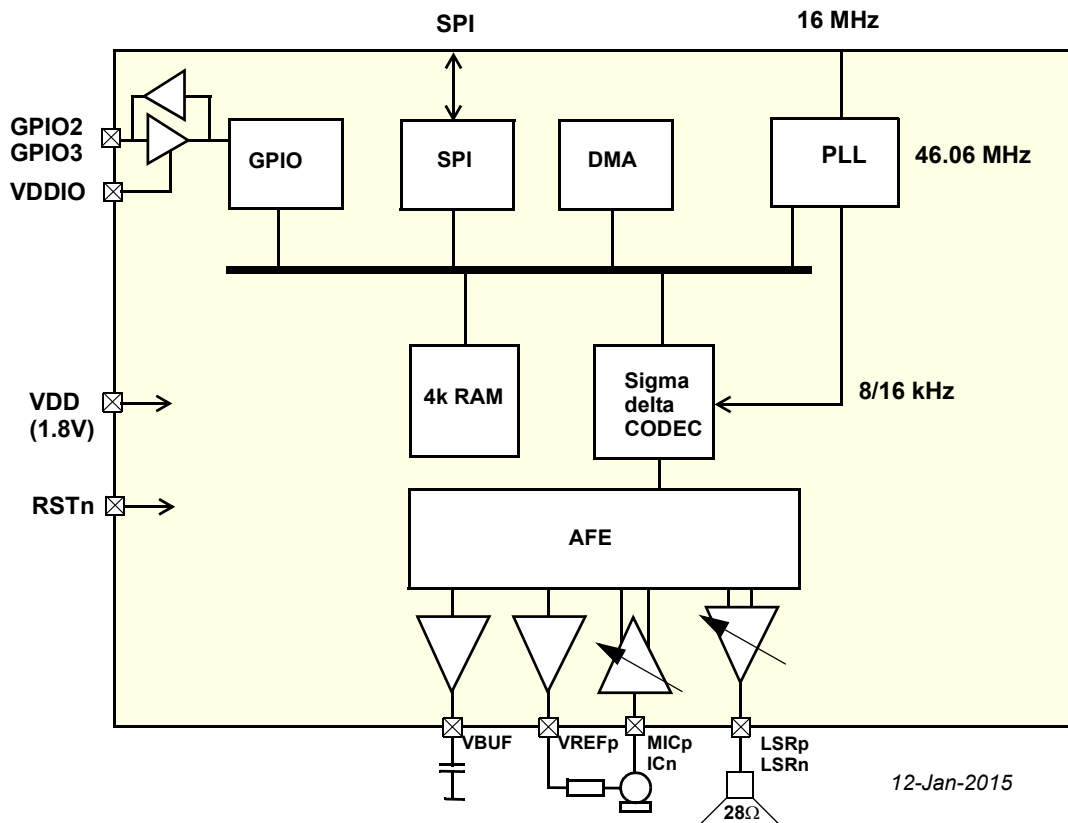

A bidirectional 14 bits Sigma-delta codec with fully differential analog front-end for microphones and loudspeakers down-to 28 ohm is connected internally via SPI to the BLE core.

The codec sample frequency up-to 16 kHz is derived from an internal 46.08 MHz PLL which uses the 16 MHz BLE clock. The codec block is internally connect to the SPI interface of the BLE core. Both require dedicated pin assignment at the BLE core while the Codec is operational.

Two general purpose I/O pins provide control of external circuits.

#### Features

- 14 bits bidirection Sigma delta codec
- Sample rate up-to 16 kHz
- Fully differential Analog front-end
  - Programmable microphone gain from 0 dB up-to plus 30 dB in steps of 2dB
  - Digital Offset compensation
  - Programmable loudspeaker attenuation +5 to minus -9 dB in 8 steps of ~2dB/step.
  - Loudspeaker impedance down-to 28 ohm
  - Programmable sidetone between microphone and loudspeaker for speech applications
- Low noise microphone supply voltage
- SPI interface for control and data
- DMA controller for low overhead sample copying from SPI to Sigma-Delta codec
- Two general purpose GPIO pins
- Dedicated 1.8V supply pin to support deep power-down with external LDO

12-Jan-2015

Figure 9 Codec with AFE Block diagram

### 4. Specifications

All MIN/MAX specification limits are guaranteed by design, production testing and/or statistical characterisation. Typical values are based on characterisation results at default measurement conditions and are informative only.

Default measurement conditions (unless otherwise specified):  $V_{BAT}(VBAT3V) = 3.0\text{ V}$  (buck mode),  $V_{BAT}(VBAT1V) = 1.2\text{ V}$  (boost mode),  $T_A = 25\text{ }^\circ\text{C}$ . All radio measurements are performed with standard RF measurement equipment providing a source/load impedance of  $50\ \Omega$ .

The specifications in the following tables are valid for the reference circuits shown in Figure 10 (Buck mode).

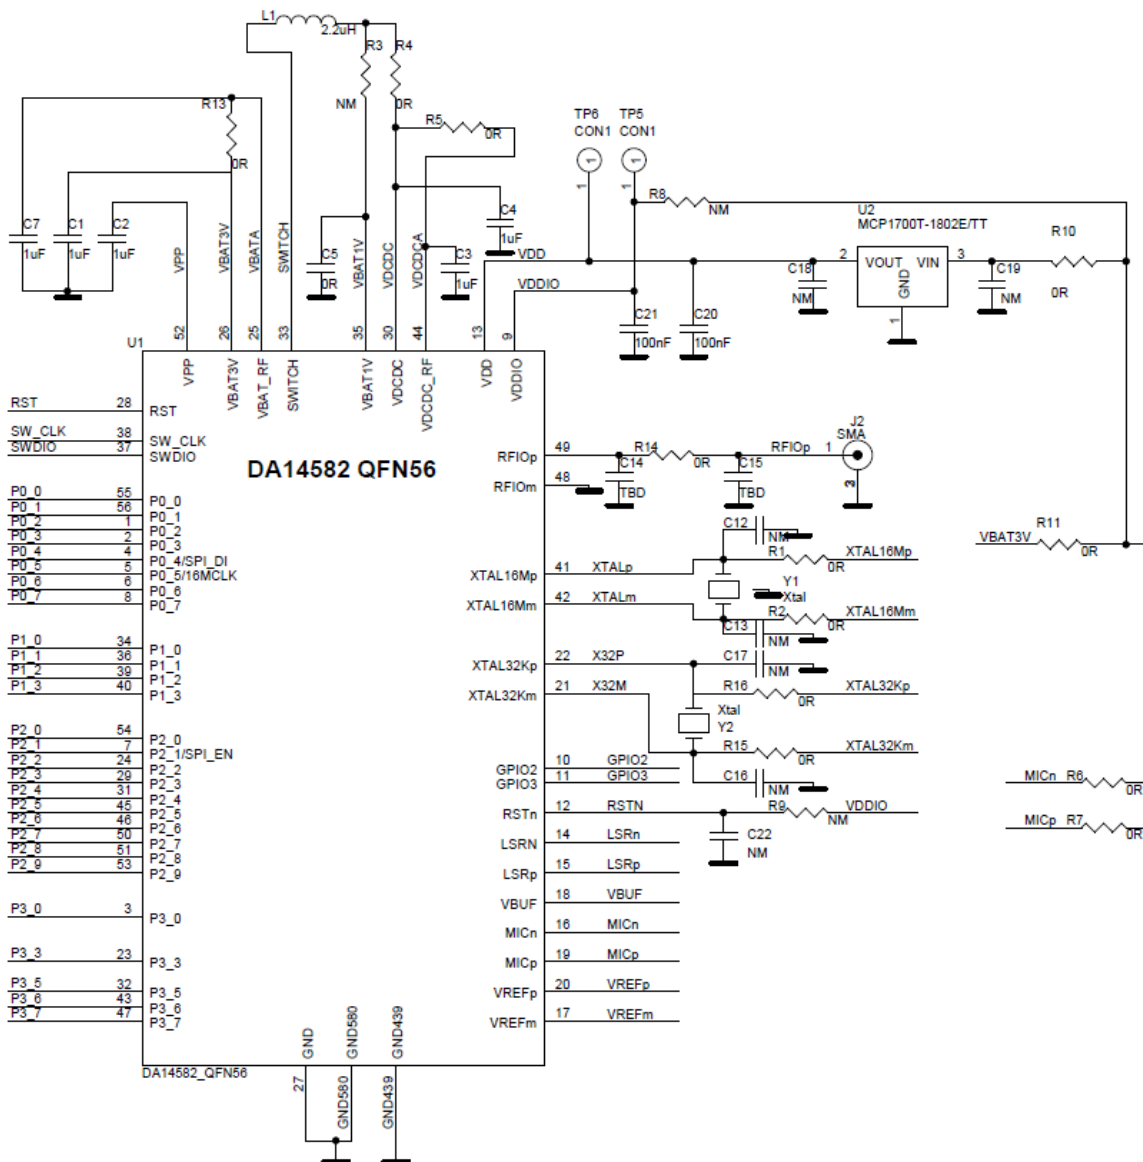

Figure 10 Lithium coin cell powered system diagram (Buck mode)

**Table 4: Absolute maximum ratings**

Parameter	Description	Conditions	Min	Typ	Max	Unit
V <sub>PIN(LIM)</sub> (default)	limiting voltage on a pin	Voltage between pin and GND <b>(Note 1)</b>	-0.1		min{3.6, V <sub>BAT_RF</sub> +0.2}	V
T <sub>STG</sub>	storage temperature		-50		150	°C
t <sub>R(SUP)</sub>	supply rise time	Power supply rise time			100	ms
V <sub>BAT(LIM)</sub> (VBA T1V)	limiting battery supply voltage	Supply voltage on VBAT1V in a boost converter application (VBAT3V is second output of boost-converter in this case) <b>(Note 1)</b>	-0.1		3.6	V
V <sub>BAT(LIM)</sub> (VBA T3V)	limiting battery supply voltage	Supply voltage on VBAT3V and VBAT_RF in a buck-converter application, pin VBAT1V is connected to ground <b>(Note 1)</b>	-0.1		3.6	V
V <sub>PIN(LIM)</sub> (1V2)	limiting voltage on a pin	XTAL32Km, XTAL16Mp, XTAL16Mm <b>(Note 1)</b>	-0.2		min(1.2, V <sub>BAT_RF</sub> +0.2)	V
V <sub>PIN(LIM)</sub> (VDC DC_RF)	limiting voltage on the VDCDC_RF pin	Supply voltage on VDCDC_RF <b>(Note 1)</b>	-0.2		min(2, V <sub>BAT_RF</sub> +0.2)	V
V <sub>PIN(LIM)</sub> (XTAL 32Kp)	limiting voltage on a pin	XTAL32Kp	-0.2		min(1.5, V <sub>BAT_RF</sub> +0.2)	V
V <sub>ESD(HBM)</sub> (WL CSP34)	electrostatic discharge voltage (Human Body Model)				2000	V
V <sub>ESD(HBM)</sub>	electrostatic discharge voltage (Human Body Model)				4000	V
V <sub>ESD(MM)</sub>	electrostatic discharge voltage (Machine Model)				200	V
V <sub>ESD(CDM)</sub>	electrostatic discharge voltage (Charged Device Model)				1000	V

**Note 1:** The device should not be exposed for prolonged periods of time to voltages between the Recommended Operating Conditions and the Absolute Maximum Ratings range.

**Table 5: Recommended operating conditions**

Parameter	Description	Conditions	Min	Typ	Max	Unit
V <sub>PP</sub>	programming voltage	Supply voltage on pin VPP during OTP programming; T <sub>J</sub> ≤ 50 °C	6.6	6.7	6.8	V

**Table 5: Recommended operating conditions**

Parameter	Description	Conditions	Min	Typ	Max	Unit
V <sub>BAT</sub> (VBAT1V)	battery supply voltage	Supply voltage on VBAT1V in a boost-converter application (VBAT3V is second output of boost-converter in this case)	0.9		3.3	V
V <sub>BAT</sub> (VBAT3V)	battery supply voltage	Supply voltage on VBAT3V and VBAT_RF in a buck-converter application, pin VBAT1V is connected to ground	2.35 <b>(Note 2)</b>		3.3	V
V <sub>BAT</sub> (VBAT3V) NO_OTP	battery supply voltage	Supply voltage on VBAT3V and VBAT_RF in a buck-converter application, pin VBAT1V is connected to ground; OTP not programmed	1.8 <b>(Note 2)</b>		3.3	V
V <sub>PIN</sub> (default)	voltage on a pin	Voltage between pin and GND	0		min(3.3, V BAT_RF+ 0.2)	V
V <sub>PIN</sub> (1V2)	voltage on a pin	XTAL32Km, XTAL16Mp, XTAL16Mm	0		1.2	V
V <sub>PIN</sub> (VDCDC_ RF)	voltage on a pin	Supply voltage on VDCDC_RF	0		2	V
T <sub>A</sub>	ambient temperature		-20		60	°C

**Note 2:** Cold boot should not be performed if voltage is less than 2.5 V because of possible corruption during OTP data mirroring. Trim values programmed in the OTP as well as the application image, should be copied into RAM while VBAT3V >= 2.5 V.

**Table 6: DC characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
I <sub>BAT</sub> (DP_SLP)_ BOOST_1kB	battery supply current	Boost configuration in deep-sleep with 1 kB retention RAM active, running from RC32K oscillator at lowest frequency		0.48		μA

I <sub>BAT</sub> (ACT_RX)_ _BUCK	battery supply current	Typical application with buck converter and receiver active, VBAT3V = 3.0 V		5.1		mA
I <sub>BAT</sub> (ACT_TX)_ BUCK	battery supply current	Typical application with buck converter and transmitter active, VBAT3V = 3.0 V		4.8		mA

**Table 7: Timing characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
$t_{STA}(BOOST)$	startup time	Boost-mode; time from deep-sleep to software start. Typical application, running from retention RAM on 16 MHz RC oscillator		1.2 <b>(Note 3)</b>		ms
$t_{STA}(BUCK)$	startup time	Buck-mode; time from deep-sleep to software start. Typical application, running from retention RAM on 16 MHz RC oscillator		1 <b>(Note 3)</b>		ms

**Note 3:** Worst-case value under Normal Operating Conditions.

**Table 8: 16 MHz Crystal Oscillator: Recommended operating conditions**

Parameter	Description	Conditions	Min	Typ	Max	Unit
$f_{XTAL}(16M)$	crystal oscillator frequency			16		MHz
ESR(16M)	equivalent series resistance				100	$\Omega$
$C_L(16M)$	load capacitance	No external capacitors are required	10		12	pF
$C_0(16M)$	shunt capacitance				5	pF
$\Delta f_{XTAL}(16M)$	crystal frequency tolerance	After optional trimming; including aging and temperature drift <b>(Note 4)</b>	-20		20	ppm
$\Delta f_{XTAL}(16M)_{UNT}$	crystal frequency tolerance	Untrimmed; including aging and temperature drift <b>(Note 5)</b>	-40		40	ppm
$P_{DRV(MAX)}(16M)$	maximum drive power	<b>(Note 6)</b>	100			$\mu W$
$V_{CLK(EXT)}(16M)$	external clock voltage	Only in case of an external reference clock on XTAL16Mp (XTAL16Mm floating or connected to mid-level 0.6 V)	1	1.2		V
$\phi_N(EXT-ERNAL)16M$	phase noise	$f_C = 50$ kHz in case of an external reference clock			-130	dBc/Hz

**Note 4:** Using the internal varicaps a wide range of crystals can be trimmed to the required tolerance.

**Note 5:** Maximum allowed frequency tolerance for compensation by the internal varicap trimming mechanism.

**Note 6:** Select a crystal which can handle a drive-level equal or more than this specification

**Table 9: 16 MHz Crystal Oscillator: Timing characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
$t_{STA(XTAL)}(16M)$	crystal oscillator startup time		0.5	2	3	ms

**Table 10: 32 kHz Crystal Oscillator: Recommended operating conditions**

Parameter	Description	Conditions	Min	Typ	Max	Unit
V <sub>CLK(EXT)</sub> (32K)	external clock voltage	peak-peak voltage of external clock at XTAL32Kp, pin XTAL32Km floating. note: XTAL32Kp is internally AC coupled	0.1	0.2	1.5	V
f <sub>XTAL</sub> (32k)	crystal oscillator frequency	frequency range for an external clock  (for a crystal, use either 32.000 kHz or 32.768 kHz)	10	32.768	100	kHz
ESR(32k)	equivalent series resistance				100	kΩ
C <sub>L</sub> (32k)	load capacitance	no external capacitors are required for a 6 pF or 7 pF crystal	6	7	9	pF
C <sub>0</sub> (32k)	shunt capacitance			1	2	pF
Δf <sub>XTAL</sub> (32k)	crystal frequency tolerance (including aging)	Timing accuracy is dominated by crystal accuracy. A much smaller value is preferred	-250		250	ppm
P <sub>DRV(MAX)</sub> (32k)	maximum drive power	<b>(Note 7)</b>	0.1			μW

**Note 7:** Select a crystal that can handle a drive-level of at least this specification.

**Table 11: 32 kHz Crystal Oscillator: Timing characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
t <sub>STA(XTAL)</sub> (32k)	crystal oscillator startup time	Typical application, time until 1000 clocks are detected <b>(Note 8)</b>		0.4		s

**Note 8:** This parameter is very much dependent on crystal parameters

**Table 12: DC-DC converter: Recommended operating conditions**

Parameter	Description	Conditions	Min	Typ	Max	Unit
L	effective inductance		1.5	2.2	3	μH
C <sub>OUT</sub> (VDCDC)	effective load capacitance	VDCDC and VDDCRF combined <b>(Note 9)</b>	0.5	1	10	μF
C <sub>OUT</sub> (VBAT3V)	effective load capacitance	VBATRF and VBAT3V combined are the second output of the boost-converter <b>(Note 9)</b>	0.5	1	10	μF

**Note 9:** A low value will result in lowest power consumption, keep this value at 1 uF or 2 uF.

**Table 13: DC-DC converter: DC characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
V <sub>O</sub> (BUCK)	output voltage	default settings		1.41		V
V <sub>O</sub> (BOOST)	output voltage	default settings, VDCDC		1.41		V
$\eta_{\text{CONV\_MAX}}(\text{BUCK})$	maximum conversion efficiency			86		%

P <sub>O</sub> (HD5)	output power level (fifth harmonic)	V <sub>DD</sub> = 3 V; maximum gain; T <sub>A</sub> = 25 °C		-70	-40	dBm
P <sub>O</sub> (NFM)	output power level in 'Near Field Mode'	V <sub>DD</sub> = 3 V; maximum gain; T <sub>A</sub> = 25 °C <b>(Note 20)</b>	-25	-20	-15	dBm

**Note 12:** Measured according to Bluetooth® Low Energy Test Specification RF-PHY.TS/4.0.1, section 6.4.1.

**Note 13:** Measurement details are explained in AN-B-017.

**Note 14:** Measured according to Bluetooth® Low Energy Test Specification RF-PHY.TS/4.0.1, section 6.4.2.

**Note 15:** Measured according to Bluetooth® Core Technical Specification document, version 4.0, volume 6, section 4.4. Published value is for n = IXIT = 4. IXIT = 5 gives the same results, IXIT = 3 gives results that are 5 dB lower.

**Note 16:** Measured according to Bluetooth® Core Technical Specification document, version 4.0, volume 6, section 4.2.

**Note 17:** Measured according to Bluetooth® Core Technical Specification document, version 4.0, volume 6, section 4.3. Due to limitations of the measurement equipment, levels of -5 dBm should be interpreted as > -5 dBm.

**Note 18:** PRF = PRSSI(min) + LRES(RSSI) x RXRSSI[7:0] ± LACC(RSSI). Thanks to constant gain biasing of RF part in the receiver, the RSSI can be used to estimate absolute power levels, rather than mere level changes. Even across the full temperature range the variation is limited.

**Note 19:** Measured according to Bluetooth® Low Energy Test Specification RF-PHY.TS/4.0.1, section 6.2.3.

**Note 20:** To activate the "Near Field Mode", program address 0x50002418 with the value 0x0030.

**Table 20: Stable low frequency RCX Oscillator: Timing characteristics**

Parameter	Description	Conditions	Min	Typ	Max	Unit
f <sub>RC</sub> (RCX)	RCX oscillator frequency	default setting, buck mode only	5	10	40	kHz
Δf <sub>RC</sub> (RCX)	RCX oscillator frequency drift	buck mode only <b>(Note 21)</b>	-500		500	ppm

**Note 21:** Maximum recommended connection interval (including slave latency) for the RCX usage is 2 s.

## 5. Codec specifications

All MIN/MAX specification limits are guaranteed by design, or production test, or statistical methods unless note 22 is added to the parameter description. Typical values are informative.

**Note 22:** This parameter(s) will not be tested in production. The MIN/MAX values are guaranteed by design and verified by characterization.

**Table 21: ABSOLUTE MAXIMUM RATINGS (Note 23)**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	MAX	UNITS
Vddio_max	Max Digital I/O supply voltage (VDDIO-VSS)			3.6	V
Vdd_max	Max Core supply voltage (VDD-VSS / AVD-AVS)			2.0	V

**Note 23:** Absolute maximum ratings are those values that may be applied for maximum 50 hours. Beyond these values, damage to the device may occur.

**Table 22: OPERATING CONDITIONS (Note 24)**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Vddio	Digital I/O supply voltage VDDIO-VSS		1.75	2.5	3.45	V
Vdd	Supply voltages VDD-VSS, AVD-AVS.	(Note 26)	1.75	1.8	1.98	V
Vdig	Voltage on digital pins.				VDDIO +0.3	V
Vana	Voltage on analog pins				2.0	V
Vpin_neg	Minimum voltage on any pin		VSSIO-0.3			V
Vprot_mic	Voltage on pins MIC (with protection)		0.4		1.4	V
Iprot_mic	Current through protection diode MICp to AGND				2.4	mA

**Note 24:** Within the specified limits, a life time of 10 years is guaranteed.

**Note 25:** Within this temperature range full operation is guaranteed.

**Note 26:** Full operating mode; the differences between AVD, VDD may never be more than 300mV; during a short period of time e.g. during power up more than 300mV difference is allowed. Analog performance is only guaranteed from 1.75-1.98V

### 5.1 CODEC ELECTRICAL CHARACTERISTICS

VDD, AVD = 1.8 Volt all signals are related to VSS, TA = -20°C - +60 °C.

**Table 23: Supply currents**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
lvddio_static	Static supply current at VDDIO.	RSTn = 0, CLK = 0, VDDIO = 3.45V.		20		uA
lvdd_static	Static supply current at VDD	RSTn = 0, CLK = 0.		150		uA
lavd_static	Static supply current at AVD	Any analog block which needs the band-gap reference voltage or current, causes this static current to flow. With BANDGAP_REG = 0x0208 and CODEC_VREF_REG = 0x00D1 and all PD bits set to '1' reduces this current to 15 uA.		100		uA
lvdd_voice	Digital supply current at VDD	SPI 16bits Rx Tx, Codec on, CLK = 16 MHz, PLL off. (Including lvdd_static)		0.75		mA
lvdd_pll	Digital PLL supply current	CLK =16 MHz Fpll = 46.06 MHz		0.15		mA
lavd_pll	Analog PLL supply current			0.6		mA
lavd_voice	Analog supply current at AVD	Reference amplifiers on, microphone amp on, LSRp/n on (no load), Codec on.		4.5		mA

**Note 27:** Total maximum chip current = lvdd\_voice + lavd\_pll\*on + ivdd\_pll\*on + lavd\_pa + lavd\_voice + lvddio\_static -lvdd\_static (is already included in lvdd\_voice))

**Additional currents** due to external components **must be added** to the total chip current : E.g current through Loudspeakers and microphone, current through (external) Pull-up/pull\_down resistors.

**Table 24: Codec Digital inputs**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Vil_dig	Logic 0 input level all digital pads	VDDIO = 1.75-3.0V <b>(Note 28)</b>			0.3*VDDIO	V
Vil_dig_33	Logic 0 input level all digital pads	VDDIO = 3-3.45V <b>(Note 28)</b>			0.9	V
Vih_dig	Logic 1 input level all digital pads	VDDIO =1.75-3.45V <b>(Note 28)</b>	0.7*VDDIO			V
Ileak_hi	Input current of all inputs with (programmable) pull-down resistors disabled	Vin = VDDIO			10	uA
Ileak_lo	Input current of all inputs with (programmable) pull-up resistors disabled.	Vin = VSS			10	uA
Ipull_up_lo	Input current with internal <b>pull up</b> enabled.	Vin = VSS VDDIO=1.75- 3.3V	20		100	uA

**Note 28:** To meet the specified Vil/Vih levels, BAT\_CTRL\_REG[PADS\_A] bits must be set to the corresponding applied VDDIO voltage

**Table 25: Digital outputs**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Vol_100u	Logic 0 output level	I <sub>out</sub> = 100 uA			0.1	V
Vol_175	Logic 0 output level	I <sub>out</sub> = 2 mA VDDIO = 1.75V-1.98V			0.2*VDDIO	V
Vol_25	Logic 0 output level	I <sub>out</sub> = 4 mA VDDIO = 2.25V-2.75V			0.2*VDDIO	V
Vol_33	Logic 0 output level	I <sub>out</sub> = 8 mA VDDIO = 3.0V-3.45V			0.2*VDDIO	V
Voh_100u	Logic 1 output level	I <sub>out</sub> = 100 uA. VDDIO = 3.45V	VDDIO - 0.1			V
Voh_175	Logic 1 output level	I <sub>out</sub> = 2 mA VDDIO = 1.75V-1.98V	0.8*VDDIO			V
Voh_25	Logic 1 output level	I <sub>out</sub> = 4mA VDDIO = 2.25V-2.75V	0.8*VDDIO			V
Voh_33	Logic 1 output level	I <sub>out</sub> = 8 mA VDDIO = 3.0-3.45V	0.8*VDDIO			V

## 5.2 ANALOG FRONTEND SPECIFICATIONS

**Table 26: Microphone amplifier**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Vmic_0dB_unt	Untrimmed differential RMS input voltage between MICp and MICn (0dBm0 reference level)	0dBm0 on COUT <b>(Note 29)</b> MIC_GAIN[3:0] = 0, @ 1020 Hz;  <u>Tolerance:</u> • 13% when untrimmed (BANDGAP_REG=8) • 6% when trimmed <b>(Note 30)</b>	114	131	149	mV
Vmic_cm_level	MICp and MICn common mode voltage			0.9		V
Amic_gain_0	Reference level at Vmic_0dB_unt	MIC_GAIN[3:0] = 0000		0		dB
Amic_gain_1	Microphone gain relative to Amic_gain_0	MIC_GAIN[3:0] = 0001		1.8		dB
Amic_gain_2		MIC_GAIN[3:0] = 0010		4.1		dB
Amic_gain_3		MIC_GAIN[3:0] = 0011		6.0		dB
Amic_gain_4		MIC_GAIN[3:0] = 0100		7.8		dB
Amic_gain_5		MIC_GAIN[3:0] = 0101		10.1		dB
Amic_gain_6		MIC_GAIN[3:0] = 0110		12.0		dB
Amic_gain_7		MIC_GAIN[3:0] = 0111		14.5		dB
Amic_gain_8		MIC_GAIN[3:0] = 1000		16.1		dB
Amic_gain_9		MIC_GAIN[3:0] = 1001		18.1		dB
Amic_gain_A		MIC_GAIN[3:0] = 1010		20.6		dB
Amic_gain_B		MIC_GAIN[3:0] = 1011		22.0		dB
Amic_gain_C		MIC_GAIN[3:0] = 1100		24.0		dB
Amic_gain_D		MIC_GAIN[3:0] = 1101		26.4		dB
Amic_gain_E		MIC_GAIN[3:0] = 1110		27.9		dB
Amic_gain_F		MIC_GAIN[3:0] = 1111		29.8		dB
Rin_mic		Resistance of activated microphone amplifier inputs (MICp, MICn and MICh) to internal buffered AGND		75	150	
Vmic_offset	Input referred DC-offset	MIC_GAIN[3:0] = 1111 3 sigma deviation limits	-2.6		+2.6	mV

**Note 29:** 0 dBm0 on COUT = -3.14 dB of max PCM value. COUT is CODEC output in test mode

**Note 30:** Trimming possibility is foreseen. At system production the bandgap reference voltage can be controlled within 2% accuracy and data can be stored in Flash. Either AVD or VREF can be trimmed within 2% accuracy. If AVD is trimmed VREF will be within 2% accuracy related to either AVD. Or vice versa VREF can be trimmed. For Vref trimming measure  $\Delta$  (VREFp VREFm) and update BANDGAP\_REG[3..0]

**Table 27: Microphone supply voltages**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Vref_unt	VREFp-VREFm untrimmed	$I_{LOAD} = 0$ mA BANDGAP_REG = 8 (Note 30)	1.41	1.5	1.59	V
Rout_vrefp	VREFp output resistance			10		Ohm
Nvrefp_idle	Peak noise on VREFp/AVS	CCITT weighted			-120	dBV
PSRRvrefp	Power supply rejection Vref output	See Figure 14 AVD2 to VREFp/ m f = 100 Hz to 4 kHz BANDGAP_REG[5:4] = 3	40			dB

Note 31: Vrefm is a clean ground input and is the 0V reference.

**Table 28: VREFp load circuits**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Cload_vrefp	VREFp (parasitic) load capacitance				20	pF
Iout_vrefp	VREFp output current				1	mA

**Figure 11 VREFp load circuit**
**Table 29: LSRp/LSRn outputs**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Vlsr_0dB_unt	Untrimmed differential RMS output voltage between LSRp and LSRn in audio mode (0dBm0 reference level)	0dBm0 on CIN (Note 32), LSRATT[2:0] = 001, @ 1020 Hz Load circuit A (see Figure 12, Table 30) with RL1= inf ohm, Cp1 or load cir- cuit B (see Figure 13) with RL2, Cp2 and Cs2  Tolerance: • 13% when untrimmed (BANDGAP_REG=8) • 6% when trimmed (Note 30)	621	714	807	mV
Rout_lsr	Resistance of activated loudspeaker amplifier outputs LSRp and LSRn			1		$\Omega$

**Table 29: LSRp/LSRn outputs**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Alsr_df_gain_1	Reference level at Vlsr_0dB_unt	LSRATT[2:0] =001		0		dB
Alsr_df_gain_0	Loudspeaker gain relative to Alsr_df_gain_1	LSRATT[2:0] =000		2.3		dB
Alsr_df_gain_2		LSRATT[2:0] =010		-2.2		dB
Alsr_df_gain_3		LSRATT[2:0] =011		-4.0		dB
Alsr_df_gain_4		LSRATT[2:0] =100		-5.7		dB
Alsr_df_gain_5		LSRATT[2:0] =101		-8.0		dB
Alsr_df_gain_6		LSRATT[2:0] =110		-9.9		dB
Alsr_df_gain_7		LSRATT[2:0] =111		-12.1		dB
Vlsr_dc	DC offset between LSRp and LSRn	LSRATT[2:0] = 3 R <sub>L1</sub> = 28 Ω 3 sigma deviation limits	-20		20	mV

**Note 32:** 0 dBm0 on CIN = -3.14 dB of max PCM value

**Table 30: LSR+/LSR- load circuits**

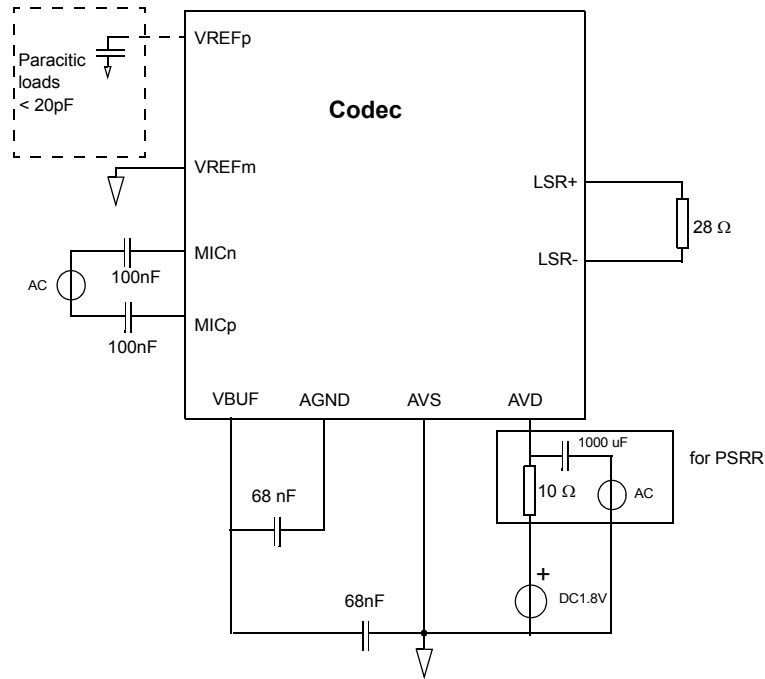

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Cp1_RI1_inf	Load capacitance	see Figure 12, R <sub>L1</sub> = ∞			30	pF
Cp1_RI1_1k	Load capacitance	see Figure 12, R <sub>L1</sub> ≤ 1 kΩ			100	pF
RI1	Load resistance		28			Ω
Cp2	Parallel load capacitance	see Figure 13			30	pF
Cs2	Serial load capacitance				30	μF
RI2	Load resistance		600			Ω

**5.4 CODEC TIMING CHARACTERISTICS**

**Table 33: PLL characteristics**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Tlock_pll_lpf0	PLL Lock time	CLK = 16 MHz Fpll = 46.08 MHz, LPF_EN = 0			0.5	ms
Fpll_vco	PLL maximum frequency			46.08		MHz

**Table 34: Digital inputs and RSTn pin**

PARAMETER	DESCRIPTION	CONDITIONS	MIN	TYP	MAX	UNITS
Tlow_rst	Minimum low time RSTn pin during active CLK.	(Note 33)	1			μs
Trf	Maximum rise and fall time of all digital inputs including RSTn pin.				25	ns

**Note 33:** spikes down to 5 ns may reset the device.

## 6. Registers

This section contains a detailed view of the DA14582 registers. It is organized as follows: An overview table is presented initially, which depicts all register names, addresses and descriptions. A detailed bit level description of each register follows.

The register file of the ARM Cortex-M0 can be found in the following documents, available on the ARM website:

**Devices Generic User Guide:**

DUI0497A\_cortex\_m0\_r0p0\_generic\_ug.pdf

**Technical Reference Manual:**

DDI0432C\_cortex\_m0\_r0p0\_trm.pdf

These documents contain the register descriptions for the Nested Vectored Interrupt Controller (NVIC), the System Control Block (SCB) and the System Timer (SysTick).

**Table 35: Register map**

Address	Port	Description
0x40008000	OTPC_MODE_REG	Mode register
0x40008004	OTPC_PCTRL_REG	Bit-programming control register
0x40008008	OTPC_STAT_REG	Status register
0x4000800C	OTPC_AHBADR_REG	AHB master start address
0x40008010	OTPC_CELADR_REG	Macrocell start address
0x40008014	OTPC_NWORDS_REG	Number of words
0x40008018	OTPC_FFPRT_REG	Ports access to fifo logic
0x4000801C	OTPC_FFRD_REG	Latest read data from the OTPC_FFPRT_REG
0x40008400	PATCH_VALID_REG	Validity Control Register
0x40008404	PATCH_VALID_SET_REG	Validity Set Control Register
0x40008408	PATCH_VALID_RESET_REG	Validity Reset Control Register
0x40008410	PATCH_ADDR0_REG	Patch entry 0: Address field
0x40008414	PATCH_DATA0_REG	Patch entry 0: Data field
0x40008418	PATCH_ADDR1_REG	Patch entry 1: Address field
0x4000841C	PATCH_DATA1_REG	Patch entry 1: Data field
0x40008420	PATCH_ADDR2_REG	Patch entry 2: Address field
0x40008424	PATCH_DATA2_REG	Patch entry 2: Data field
0x40008428	PATCH_ADDR3_REG	Patch entry 3: Address field
0x4000842C	PATCH_DATA3_REG	Patch entry 3: Data field
0x40008430	PATCH_ADDR4_REG	Patch entry 4: Address field
0x40008434	PATCH_DATA4_REG	Patch entry 4: Data field
0x40008438	PATCH_ADDR5_REG	Patch entry 5: Address field
0x4000843C	PATCH_DATA5_REG	Patch entry 5: Data field
0x40008440	PATCH_ADDR6_REG	Patch entry 6: Address field
0x40008444	PATCH_DATA6_REG	Patch entry 6: Data field
0x40008448	PATCH_ADDR7_REG	Patch entry 7: Address field
0x4000844C	PATCH_DATA7_REG	Patch entry 7: Data field
0x50000000	CLK_AMBA_REG	HCLK, PCLK, divider and clock gates
0x50000002	CLK_FREQ_TRIM_REG	Xtal frequency trimming register
0x50000004	CLK_PER_REG	Peripheral divider register
0x50000008	CLK_RADIO_REG	Radio PLL control register
0x5000000A	CLK_CTRL_REG	Clock control register
0x50000010	PMU_CTRL_REG	Power Management Unit control register
0x50000012	SYS_CTRL_REG	System Control register
0x50000014	SYS_STAT_REG	System status register
0x50000016	TRIM_CTRL_REG	Control trimming of the XTAL16M
0x50000020	CLK_32K_REG	32 kHz oscillator register
0x50000022	CLK_16M_REG	16 MHz RC-oscillator register
0x50000024	CLK_RCX20K_REG	20 kHz RXC-oscillator control register
0x50000028	BANDGAP_REG	Bandgap trimming
0x5000002A	ANA_STATUS_REG	Status bit of analog (power management) circuits
0x50000100	WKUP_CTRL_REG	Control register for the wakeup counter
0x50000102	WKUP_COMPARE_REG	Number of events before wakeup interrupt

**Table 35: Register map**

Address	Port	Description
0x50000104	WKUP_RESET_IRQ_REG	Reset wakeup interrupt
0x50000106	WKUP_COUNTER_REG	Actual number of events of the wakeup counter
0x50000108	WKUP_RESET_CNTR_REG	Reset the event counter
0x5000010A	WKUP_SELECT_P0_REG	Select which inputs from P0 port can trigger wkup counter
0x5000010C	WKUP_SELECT_P1_REG	Select which inputs from P1 port can trigger wkup counter
0x5000010E	WKUP_SELECT_P2_REG	Select which inputs from P2 port can trigger wkup counter
0x50000110	WKUP_SELECT_P3_REG	Select which inputs from P3 port can trigger wkup counter
0x50000112	WKUP_POL_P0_REG	Select the sensitivity polarity for each P0 input
0x50000114	WKUP_POL_P1_REG	Select the sensitivity polarity for each P1 input
0x50000116	WKUP_POL_P2_REG	Select the sensitivity polarity for each P2 input
0x50000118	WKUP_POL_P3_REG	Select the sensitivity polarity for each P3 input
0x50000200	QDEC_CTRL_REG	Quad Decoder control register
0x50000202	QDEC_XCNT_REG	Counter value of the X Axis
0x50000204	QDEC_YCNT_REG	Counter value of the Y Axis
0x50000206	QDEC_CLOCKDIV_REG	Clock divider register
0x50000208	QDEC_CTRL2_REG	Quad Decoder control register
0x5000020A	QDEC_ZCNT_REG	Z_counter
0x50001000	UART_RBR_THR_DLL_REG	Receive Buffer Register
0x50001004	UART_IER_DLH_REG	Interrupt Enable Register
0x50001008	UART_IIR_FCR_REG	Interrupt Identification Register/FIFO Control Register
0x5000100C	UART_LCR_REG	Line Control Register
0x50001010	UART_MCR_REG	Modem Control Register
0x50001014	UART_LSR_REG	Line Status Register

0x50003100	WATCHDOG_REG	Watchdog timer register.
0x50003102	WATCHDOG_CTRL_REG	Watchdog control register.
0x50003200	CHIP_ID1_REG	Chip identification register 1.
0x50003201	CHIP_ID2_REG	Chip identification register 2.
0x50003202	CHIP_ID3_REG	Chip identification register 3.
0x50003203	CHIP_SWC_REG	Software compatibility register.
0x50003204	CHIP_REVISION_REG	Chip revision register.
0x50003205	CHIP_CONFIG1_REG	Chip configuration register 1.
0x50003206	CHIP_CONFIG2_REG	Chip configuration register 2.
0x50003207	CHIP_CONFIG3_REG	Chip configuration register 3.
0x5000320A	CHIP_TEST1_REG	Chip test register 1.

**Table 35: Register map**

Address	Port	Description
0x5000320B	CHIP_TEST2_REG	Chip test register 2.
0x50003300	SET_FREEZE_REG	Controls freezing of various timers/counters.
0x50003302	RESET_FREEZE_REG	Controls unfreezing of various timers/counters.
0x50003304	DEBUG_REG	Various debug information register.
0x50003306	GP_STATUS_REG	General purpose system status register.
0x50003308	GP_CONTROL_REG	General purpose system control register.
0x50003400	TIMER0_CTRL_REG	Timer0 control register
0x50003402	TIMER0_ON_REG	Timer0 on control register
0x50003404	TIMER0_RELOAD_M_REG	16 bits reload value for Timer0
0x50003406	TIMER0_RELOAD_N_REG	16 bits reload value for Timer0
0x50003408	PWM2_DUTY_CYCLE	Duty Cycle for PWM2
0x5000340A	PWM3_DUTY_CYCLE	Duty Cycle for PWM3
0x5000340C	PWM4_DUTY_CYCLE	Duty Cycle for PWM4
0x5000340E	TRIPLE_PWM_FREQUENCY	Frequency for PWM 2,3 and 4
0x50003410	TRIPLE_PWM_CTRL_REG	PWM 2 3 4 Control

**Table 36: OTPC\_MODE\_REG (0x40008000)**

Bit	Mode	Symbol	Description	Reset
31:30	-	-	Reserved	0x0
29:28	R/W	OTPC_MODE_PRG_PORT_MUX	Selects the source that is connected to the prg_port port of the controller. 00 - {16'd0, BANDGAP_REG[15:0]} 01 - {RF_RSSI_COMP_CTRL_REG[15:0], 8'd0, RFIO_CTRL1_REG[7:0]} 10 - {3'd0, RF_LNA_CTRL3_REG[4:0], RF_LNA_CTRL2_REG[11:0], RF_LNA_CTRL1_REG[11:0]} 11 - {28'd0, RF_VCO_CTRL_REG[3:0]}  See OTPC_MODE_PRG_PORT_SEL about the use of the prg_port	0x0
27:9	-	-	Reserved	0x0
8	R/W	OTPC_MODE_PRG_FAST	Defines the timing that will be used for all the programming activities (APROG, MPROG and TWR) 0 - Selects the normal timing 1 - Selects the fast timing	0
7	R/W	OTPC_MODE_PRG_PORT_SEL	Selects an alternative data source for the programming of the OTP macrocells, when the controller is configured in APROG mode. 0 - The fifo will be used as the data source. The fifo will be filled with a way defined by the register OTPC_MODE_USE_DMA. The number of words that will be programmed is defined by OTPC_NWORDS. 1 - Only one word will be programmed. The value of the word is contained in the prg_port port of the controller. The values of the registers OTPC_MODE_USE_DMA, OTPC_NWORDS and the contents of the FIFO will not be used.	0x0
6	R/W	OTPC_MODE_TWO_CC_ACC	Defines the duration of each read from the OTP macrocells. 0 - Reads 16 bits of data every one clock cycle. 1 - Reads 16 bits of data every two clock cycles.	0x0
5	R/W	OTPC_MODE_FIFO_FLUSH	Writing 1, removes any content from the FIFO. This bit returns automatically to 0.	0x0

**Table 36: OTPC\_MODE\_REG (0x40008000)**

Bit	Mode	Symbol	Description	Reset
4	R/W	OTPC_MODE_USE_DMA	Selects the use of the dma, when the controller is configured in one of the modes: AREAD or APROG. 0 - DMA is not used. The data should be transferred from/to controller through OTPC_FFPRT_REG 1 - DMA is used. Data transfers from/to controller are performed automatically. The AHB base address should be configured in OTPC_AHBADR_REG before the selection of the mode. If programming of the OTPC_MODE_REG is performed through the serial interface, the OTPC_MODE_USE_DMA will be set to 0 automatically. If the controller is in APROG mode and the OTPC_MODE_PRG_PORT_SEL is enabled, the dma will stay inactive.	0x0
3	-	-	Reserved	0x0
2:0	R/W	OTPC_MODE_MODE	Defines the mode of operation of the OTPC controller. The encoding of the modes is as follows: 000 - STBY mode 001 - MREAD mode 010 - MPROG mode 011 - AREAD mode 100 - APROG mode 101 - Test mode. Reserved 110 - Test mode. Reserved 111 - Test mode. Reserved To manually move between modes, always return to STBY mode first.	0x0

**Table 37: OTPC\_PCTRL\_REG (0x40008004)**

Bit	Mode	Symbol	Description	Reset
31:28	-	-	Reserved	0x0
27	R/W	OTPC_PCTRL_ENU	Enables the programming in the upper bank of the OTP. 0 - Programming sequence is not applied in the upper bank. 1 - Programming sequence is applied in the upper bank.	0x0
26	R/W	OTPC_PCTRL_BITU	Defines the value of the selected bit in the upper bank, after the programming sequence.	0x0
25	R/W	OTPC_PCTRL_ENL	Enables the programming in the lower bank. 0 - The programming sequence is not applied in the lower bank. 1 - The programming sequence is applied in the lower bank.	0x0
24	R/W	OTPC_PCTRL_BITL	Defines the value of the selected bit in the lower bank, after the programming sequence.	0x0
23	R/W	OTPC_PCTRL_BSEL U	Selects between the U1 and U0 byte for the programming sequence in the upper bank. 0 - Program the U0 byte 1 - Program the U1 byte	0x0
22:20	R/W	OTPC_PCTRL_BADR U	Selects the bit inside the Ux (x=0,1) byte, which will be programmed in the upper bank.	0x0
19	R/W	OTPC_PCTRL_BSEL L	Selects between the L1 and L0 byte for the programming sequence in the lower bank. 0 - Program the L0 byte 1 - Program the L1 byte	0x0
18:16	R/W	OTPC_PCTRL_BADR L	Selects the bit inside the Lx (x=0,1) byte, which will be programmed in the lower bank.	0x0

**Table 37: OTPC\_PCTRL\_REG (0x40008004)**

Bit	Mode	Symbol	Description	Reset
15:13	-	-	Reserved	0x0
12:0	R/W	OTPC_PCTRL_WADDR	Defines the address of a 32 bits word {U1,L1,U0,L0} in the macrocells, where one or two bits will be programmed. There are two macrocell banks, with 8 bits each. Each bank contribute with two memory positions for each 32 bits word. The Ux, Lx represent the bytes of the upper and lower bank respectively.	0x0

**Table 38: OTPC\_STAT\_REG (0x40008008)**

Bit	Mode	Symbol	Description	Reset
31:29	-	-	Reserved	0x0
28:16	R	OTPC_STAT_NWORDS	Contains the current value of the words to be processed.	0
15	R	OTPC_STAT_TERR_U	Indicates the upper bank as the source of a test error. This value is valid when OTPC_STAT_TERROR is valid. 0 - There is no test error in the upper bank 1 - A test error has occurred in the upper bank	0x0
14	R	OTPC_STAT_TERR_L	Indicates the lower bank as the source of a test error. The value is valid when OTPC_STAT_TERROR is valid. 0 - There is no test error in the lower bank 1 - A test error has occurred in the lower bank	0x0
13	R	OTPC_STAT_PERR_U	Indicates the upper bank as the source of a programming error. The value is valid when OTPC_STAT_PERROR is valid. 0 - There is no programming error in the upper bank 1 - A programming error has occurred in the upper bank	0x0
12	R	OTPC_STAT_PERR_L	Indicates the lower bank as the source of a programming error. The value is valid when OTPC_STAT_PERROR is valid. 0 - There is no programming error in the lower bank 1 - A programming error has occurred in the lower bank	0x0
11:8	R	OTPC_STAT_FWORDS	Indicates the number of words which contained in the fifo of the controller.	0x0
7:5	-	-	Reserved	0x0
4	R	OTPC_STAT_ARDY	Monitors the progress of read or programming operations while in the AREAD or APROG modes. 0 - The controller is busy while reading or programming (AREAD or APROG modes). 1 - The controller is not busy in AREAD or APROG mode.	0x1
3	R	OTPC_STAT_TERROR	Indicates the result of a test sequence. Should be checked after the end of a TBLANK, TDEC and TWR mode (OTPC_STAT_TRDY= 1). 0 - The test sequence ends with no error. 1 - The test sequence has failed.	0x0
2	R	OTPC_STAT_TRDY	Indicates the state of a test mode. Should be used to monitor the progress of the TBLANK, TDEC and TWR modes. 0 - The controller is busy. A test mode is in progress. 1 - There is no active test mode.	0x1

**Table 38: OTPC\_STAT\_REG (0x40008008)**

Bit	Mode	Symbol	Description	Reset
1	R	OTPC_STAT_PERRO R	Indicates that an error has occurred during the bit-programming process. 0 - No error during the bit-programming process. 1 - The process of bit-programming failed. When the controller is in MPROG mode, this bit should be checked after the end of the programming process (OTPC_STAT_PRDY= 1). During APROG mode, the value of this field is normal to change periodically. Upon finishing the operation in the APROG mode (OTPC_STAT_ARDY= 1), this field indicates if the programming has failed or ended successfully.	0x0
0	R	OTPC_STAT_PRDY	Indicates the state of a bit-programming process. 0 - The controller is busy. A bit-programming is in progress 1 - The logic which performs bit-programming is idle. When the controller is in MPROG mode, this bit should be used to monitor the progress of a programming request. During APROG mode, the value of this field it is normal to changing periodically.	0x1

**Table 39: OTPC\_AHBADR\_REG (0x4000800C)**

Bit	Mode	Symbol	Description	Reset
31:2	R/W	OTPC_AHBADR	The AHB address used by the AHB master interface of the controller ( bits [31:2]).	0x0
1:0	-	-	Reserved	0x0

**Table 40: OTPC\_CELADR\_REG (0x40008010)**

Bit	Mode	Symbol	Description	Reset
31:13	-	-	Reserved	0x0
12:0	R/W	OTPC_CELADR	Defines a word address inside the macrocell. Used in modes AREAD and APROG and is automatically updated.	0x0

**Table 41: OTPC\_NWORDS\_REG (0x40008014)**

Bit	Mode	Symbol	Description	Reset
31:13	-	-	Reserved	0x0
12:0	R/W	OTPC_NWORDS	The number of words (minus one) for reading/programming during the AREAD/APROG mode. If in APROG mode, and the OTPC_MODE_PRG_PORT_SEL is enabled (=1), this register will not be used and will stay unchanged. During mirroring, this register reflects the current amount of data that will be copied. It keeps its value until be written by the software with a new value. The number of the words that remaining to be processed by the controller is contained in the field OTPC_STAT_NWORDS.	0x0

**Table 42: OTPC\_FFPRT\_REG (0x40008018)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	OTPC_FFPRT	Provides access to the fifo through an access port. Write this register with the corresponding data, when the APROG mode is selected and the DMA is disabled. Read from this register the corresponding data, when the AREAD mode is selected and the DMA is disabled. Check OTPC_STAT_FWORDS register for data/space availability, before accessing the fifo.	0x0

**Table 43: OTPC\_FFRD\_REG (0x4000801C)**

Bit	Mode	Symbol	Description	Reset
31:0	R	OTPC_FFRD	Contains the value read from the fifo, after a read of the OTPC_FFPRT_REG register.	0x0

**Table 44: PATCH\_VALID\_REG (0x40008400)**

Bit	Mode	Symbol	Description	Reset
31:8	-	-	Reserved	0x0
7:0	R/W	PATCH_VALID	Indicates which patch entry is valid. For example, when bit 0 is high it indicates that entry 0 is valid, i.e. the values of PATCH_ADDR0_REG / PATCH_DATA0_REG, are effective.	0x0

**Table 45: PATCH\_VALID\_SET\_REG (0x40008404)**

Bit	Mode	Symbol	Description	Reset
31:8	-	-	Reserved	0x0
7:0	R/W	PATCH_VALID_SET	Writing a bit with 1 will set the corresponding bit of PATCH_VALID_REG to 1. Writing a bit with 0 is ignored. Read always as 0.	0x0

**Table 46: PATCH\_VALID\_RESET\_REG (0x40008408)**

Bit	Mode	Symbol	Description	Reset
31:8	-	-	Reserved	0x0
7:0	R/W	PATCH_VALID_RESET	Writing a bit with 1 will clear the corresponding bit of PATCH_VALID_REG to 0. Writing a bit with zero is ignored. Read always as 0.	0x0

**Table 47: PATCH\_ADDR0\_REG (0x40008410)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_ADDR	This is the value which will be compared to the address on the AHB. If a match occurs, the data bus will be filled with the value in the respective PATCH_DATAx_REG. Bits [1:0] are read-only and always read as "0". Never use the base address 0x0 for values in PATCH_ADDRx_REG because HW Patch block is located after the Address Remapping block.	0x0

**Table 48: PATCH\_DATA0\_REG (0x40008414)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_DATA	This is the value which will be injected into the data bus if there is a match on the comparison of the address with the respective PATCH_ADDRx_REG	0x0

**Table 49: PATCH\_ADDR1\_REG (0x40008418)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_ADDR	This is the value which will be compared to the address on the AHB. If a match occurs, the data bus will be filled with the value in the respective PATCH_DATAx_REG. Bits [1:0] are read-only and always read as "0". Never use the base address 0x0 for values in PATCH_ADDRx_REG because HW Patch block is located after the Address Remapping block.	0x0

**Table 50: PATCH\_DATA1\_REG (0x4000841C)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_DATA	This is the value which will be injected into the data bus if there is a match on the comparison of the address with the respective PATCH_ADDRx_REG	0x0

**Table 51: PATCH\_ADDR2\_REG (0x40008420)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_ADDR	This is the value which will be compared to the address on the AHB. If a match occurs, the data bus will be filled with the value in the respective PATCH_DATAx_REG. Bits [1:0] are read-only and always read as "0". Never use the base address 0x0 for values in PATCH_ADDRx_REG because HW Patch block is located after the Address Remapping block.	0x0

**Table 52: PATCH\_DATA2\_REG (0x40008424)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_DATA	This is the value which will be injected into the data bus if there is a match on the comparison of the address with the respective PATCH_ADDRx_REG	0x0

**Table 53: PATCH\_ADDR3\_REG (0x40008428)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_ADDR	This is the value which will be compared to the address on the AHB. If a match occurs, the data bus will be filled with the value in the respective PATCH_DATAx_REG. Bits [1:0] are read-only and always read as "0". Never use the base address 0x0 for values in PATCH_ADDRx_REG because HW Patch block is located after the Address Remapping block.	0x0

**Table 54: PATCH\_DATA3\_REG (0x4000842C)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_DATA	This is the value which will be injected into the data bus if there is a match on the comparison of the address with the respective PATCH_ADDRx_REG	0x0

**Table 55: PATCH\_ADDR4\_REG (0x40008430)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_ADDR	This is the value which will be compared to the address on the AHB. If a match occurs, the data bus will be filled with the value in the respective PATCH_DATAx_REG. Bits [1:0] are read-only and always read as "0". Never use the base address 0x0 for values in PATCH_ADDRx_REG because HW Patch block is located after the Address Remapping block.	0x0

**Table 56: PATCH\_DATA4\_REG (0x40008434)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_DATA	This is the value which will be injected into the data bus if there is a match on the comparison of the address with the respective PATCH_ADDRx_REG	0x0

**Table 57: PATCH\_ADDR5\_REG (0x40008438)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_ADDR	This is the value which will be compared to the address on the AHB. If a match occurs, the data bus will be filled with the value in the respective PATCH_DATAx_REG. Bits [1:0] are read-only and always read as "0". Never use the base address 0x0 for values in PATCH_ADDRx_REG because HW Patch block is located after the Address Remapping block.	0x0

**Table 58: PATCH\_DATA5\_REG (0x4000843C)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_DATA	This is the value which will be injected into the data bus if there is a match on the comparison of the address with the respective PATCH_ADDRx_REG	0x0

**Table 59: PATCH\_ADDR6\_REG (0x40008440)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_ADDR	This is the value which will be compared to the address on the AHB. If a match occurs, the data bus will be filled with the value in the respective PATCH_DATAx_REG. Bits [1:0] are read-only and always read as "0". Never use the base address 0x0 for values in PATCH_ADDRx_REG because HW Patch block is located after the Address Remapping block.	0x0

**Table 60: PATCH\_DATA6\_REG (0x40008444)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_DATA	This is the value which will be injected into the data bus if there is a match on the comparison of the address with the respective PATCH_ADDRx_REG	0x0

**Table 61: PATCH\_ADDR7\_REG (0x40008448)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_ADDR	This is the value which will be compared to the address on the AHB. If a match occurs, the data bus will be filled with the value in the respective PATCH_DATAx_REG. Bits [1:0] are read-only and always read as "0". Never use the base address 0x0 for values in PATCH_ADDRx_REG because HW Patch block is located after the Address Remapping block.	0x0

**Table 62: PATCH\_DATA7\_REG (0x4000844C)**

Bit	Mode	Symbol	Description	Reset
31:0	R/W	PATCH_DATA	This is the value which will be injected into the data bus if there is a match on the comparison of the address with the respective PATCH_ADDRx_REG	0x0

**Table 63: CLK\_AMBA\_REG (0x50000000)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7	R/W	OTP_ENABLE	Clock enable for OTP controller	0x0
6	-	-	Reserved	0x0
5:4	R/W	PCLK_DIV	APB interface clock (PCLK). Divider is cascaded with HCLK_DIV. PCLK is HCLK divided by: 0x0: divide by 1 0x1: divide by 2 0x2: divide by 4 0x3: divide by 8	0x2
3:2	-	-	Reserved	0x0
1:0	R/W	HCLK_DIV	AHB interface and microprocessor clock (HCLK). HCLK is source clock divided by: 0x0: divide by 1 0x1: divide by 2 0x2: divide by 4 0x3: divide by 8	0x2

**Table 64: CLK\_FREQ\_TRIM\_REG (0x50000002)**

Bit	Mode	Symbol	Description	Reset
15:11	-	-	Reserved	0x0
10:8	R/W	COARSE_ADJ	Xtal frequency course trimming register. 0x0: lowest frequency 0x7: highest frequency Increment or decrement the binary value with 1. Wait approximately 200 us to allow the adjustment to settle.	0x0

**Table 64: CLK\_FREQ\_TRIM\_REG (0x50000002)**

Bit	Mode	Symbol	Description	Reset
7:0	R/W	FINE_ADJ	Xtal frequency fine trimming register. 0x00: lowest frequency 0xFF: highest frequency	0x0

**Table 65: CLK\_PER\_REG (0x50000004)**

Bit	Mode	Symbol	Description	Reset
15	R/W	QUAD_ENABLE	Enable the Quadrature clock	0x0
14:13	-	-	Reserved	0x0
11	R/W	SPI_ENABLE	Enable SPI clock	0x0
10	-	-	Reserved	0x0
9:8	R/W	SPI_DIV	Division factor for SPI 0x0: divide by 1 0x1: divide by 2 0x2: divide by 4 0x3: divide by 8	0x0
7	R/W	UART1_ENABLE	Enable UART1 clock	0x0
6	R/W	UART2_ENABLE	Enable UART2 clock	0x0
5	R/W	I2C_ENABLE	Enable I2C clock	0x0
4	R/W	WAKEUPCT_ENABLE	Enable Wakeup CaptureTimer clock	0x0
3	R/W	TMR_ENABLE	Enable TIMER0 and TIMER2 clock	0x0
2	-	-	Reserved	0x0
1:0	R/W	TMR_DIV	Division factor for TIMER0 0x0: divide by 1 0x1: divide by 2 0x2: divide by 4 0x3: divide by 8	0x0

**Table 66: CLK\_RADIO\_REG (0x50000008)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7	R/W	BLE_ENABLE	Enable the BLE core clocks	0x0
6	R/W	BLE_LP_RESET	Reset for the BLE LP timer	0x1
5:4	R/W	BLE_DIV	Division factor for BLE core blocks 0x0: divide by 1 0x1: divide by 2 0x2: divide by 4 0x3: divide by 8 The programmed frequency should not be lower than 8 MHz and not faster than the programmed CPU clock frequency. Refer also to BLE_CNTL2_REG[BLE_CLK_SEL].	0x0
3	R/W	RFCU_ENABLE	Enable the RF control Unit clock	0x0
2	-	-	Reserved	0x0
1:0	R/W	RFCU_DIV	Division factor for RF Control Unit 0x0: divide by 1 0x1: divide by 2 0x2: divide by 4 0x3: divide by 8 The programmed frequency must be exactly 8 MHz.	0x0

**Table 67: CLK\_CTRL\_REG (0x5000000A)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7	R	RUNNING_AT_XTAL16M	Indicates that the XTAL16M clock is used as clock, and may not be switched off	0x1
6	R	RUNNING_AT_RC16M	Indicates that the RC16M clock is used as clock	0x0
5	R	RUNNING_AT_32K	Indicates that either the RC32k or XTAL32k is being used as clock	0x0
4	-	-	Reserved	0x0
3	R/W	XTAL16M_SPIKE_FLT_DISABLE	Disable spikefilter in digital clock	0x0
2	R/W	XTAL16M_DISABLE	Setting this bit instantaneously disables the 16 MHz crystal oscillator. Also, after sleep/wakeup cycle, the oscillator will not be enabled. This bit may not be set to '1' when "RUNNING_AT_XTAL16M is '1' to prevent deadlock. After resetting this bit, wait for XTAL16_SETTLED or XTAL16_TRIM_READY to become '1' before switching to XTAL16 clock source.	0x0
1:0	R/W	SYS_CLK_SEL	Selects the clock source. 0x0: XTAL16M (check the XTAL16_SETTLED and XTAL16_TRIM_READY bits!!) 0x1: RC16M 0x2/0x3: either RC32k or XTAL32k is used	0x0

**Table 68: PMU\_CTRL\_REG (0x50000010)**

Bit	Mode	Symbol	Description	Reset
15:12	-	-	Reserved	0x0
11:8	R/W	RETENTION_MODE	Select the retainability of the 4 retention RAM macros. '1' is retainable, '0' is power gated. (3) is RETRAM4 (2) is RETRAM3 (1) is RETRAM2 (0) is RETRAM1	0x0
7	R/W	FORCE_BOOST	Force the DCDC into boost mode at next wakeup. Setting this bit reduces the deepsleep current. FORCE_BOOST has highest priority. When either FORCE_BOOST or FORCE_BUCK have been written, these bits cannot be changed.	0x0
6	R/W	FORCE_BUCK	Force the DCDC into buck mode at next wakeup. Setting this bit reduces the deepsleep current. FORCE_BOOST has highest priority. When either FORCE_BOOST or FORCE_BUCK have been written, these bits cannot be changed.	0x0
5:4	R/W	OTP_COPY_DIV	Sets the HCLK division during OTP mirroring	0x0
2	R/W	RADIO_SLEEP	Put the digital part of the radio in powerdown	0x1
1	R/W	PERIPH_SLEEP	Put all peripherals (I2C, UART, SPI, ADC) in powerdown	0x1
0	R/W	RESET_ON_WAKEUP	Perform a Hardware Reset after waking up. Booter will be started.	0x0

**Table 69: SYS\_CTRL\_REG (0x50000012)**

Bit	Mode	Symbol	Description	Reset
15	W	SW_RESET	Writing a '1' to this bit will reset the device, except for: SYS_CTRL_REG CLK_FREQ_TRIM_REG ...	0x0
9	R/W	TIMEOUT_DISABLE	Disables timeout in Power statemachine. By default, the statemachine continues if after 2 ms the blocks are not started up. This can be read back from ANA_STATUS_REG.	0x0
8	-	-	Reserved	0x0
7	R/W	DEBUGGER_ENABLE	Enable the debugger. This bit is set by the booter according to the OTP header. If not set, the SWDIO and SW_CLK can be used as gpio ports.	0x0
6	R/W	OTPC_RESET_REQ	Reset request for the OTP controller.	0x0
5	R/W	PAD_LATCH_EN	Latches the control signals of the pads for state retention in powerdown mode. 0: Control signals are retained 1: Latch is transparent, pad can be recontrolled	0x1
4	R/W	OTP_COPY	Enables OTP to SysRAM copy action after waking up PD_SYS	0x0
3	R/W	CLK32_SOURCE	Sets the clock source of the 32 kHz clock 0 = RC-oscillator 1 = 32 kHz crystal oscillator	0x0
2	R/W	RET_SYSRAM	Sets the development phase mode. The PD_SYS is not actually power gated (SysRAM is retained). No copy action to SysRAM is done when the system wakes up. For emulating startup time, the OTP_COPY bit still needs to be set.	0x0
1:0	R/W	REMAP_ADR0	Controls which memory is located at address 0x0000 for execution. 0x0: ROM 0x1: OTP 0x2: SysRAM 0x3: RetRAM	0x0

**Table 70: SYS\_STAT\_REG (0x50000014)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7	R	XTAL16_SETTLED	Indicates that XTAL16 has had > 2 ms of settle time	0x0
6	R	XTAL16_TRIM_READY	Indicates that XTAL trimming mechanism is ready, i.e. the trimming equals CLK_FREQ_TRIM_REG.	0x1
5	R	DBG_IS_UP	Indicates that PD_DBG is functional	0x0
4	R	DBG_IS_DOWN	Indicates that PD_DBG is in power down	0x1
3	R	PER_IS_UP	Indicates that PD_PER is functional	0x0
2	R	PER_IS_DOWN	Indicates that PD_PER is in power down	0x1
1	R	RAD_IS_UP	Indicates that PD_RAD is functional	0x0
0	R	RAD_IS_DOWN	Indicates that PD_RAD is in power down	0x1

**Table 71: TRIM\_CTRL\_REG (0x50000016)**

Bit	Mode	Symbol	Description	Reset
7:4	R/W	TRIM_TIME	Defines the delay between XTAL16M enable and applying the CLK_FREQ_TRIM_REG in steps of 250 us. 0x0: apply directly 0x1: wait between 0 and 250 us 0x2: wait between 250 us and 500 us etc. <b>(Note 34)</b>	0xA
3:0	R/W	SETTLE_TIME	Defines the delay between applying CLK_FREQ_TRIM_REG and XTAL16_SETTLED in steps of 250 us. 0x0: XTAL16_SETTLED is set directly 0x1: wait between 0 and 250 us 0x2: wait between 250 us and 500 us etc.	0x2

**Note 34:** The period duration of 250 us is derived by dividing the RC16M clock signal by 4000. Consequently, the period duration may vary over temperature.

**Table 72: CLK\_32K\_REG (0x50000020)**

Bit	Mode	Symbol	Description	Reset
15:13	-	-	Reserved	0x0
12	R/W	XTAL32K_DISABLE_AMPREG	Setting this bit disables the amplitude regulation of the XTAL32kHz oscillator. Set this bit to '1' for an external clock applied at XTAL32Kp. Keep this bit '0' with a crystal between XTAL32Kp and XTAL32Km.	0x0
11:8	R/W	RC32K_TRIM	Controls the frequency of the RC32K oscillator. 0x0: lowest frequency 0x7: default 0xF: highest frequency	0x7
7	R/W	RC32K_ENABLE	Enables the 32 kHz RC oscillator	0x1
6:3	R/W	XTAL32K_CUR	Bias current for the 32kHz XTAL oscillator. 0x0: minimum 0x3: default 0xF: maximum For each application there is an optimal setting for which the startup behaviour is optimal.	0x3
2:1	R/W	XTAL32K_RBIAS	Setting for the bias resistor of the 32 kHz XTAL oscillator. 0x0: maximum 0x3: minimum Preferred setting will be provided by Dialog.	0x2
0	R/W	XTAL32K_ENABLE	Enables the 32 kHz XTAL oscillator	0x0

**Table 73: CLK\_16M\_REG (0x50000022)**

Bit	Mode	Symbol	Description	Reset
15:10	-	-	Reserved	0x0
9	R/W	XTAL16_NOISE_FILTER_ENABLE	Enables noise filter in 16 MHz crystal oscillator	0x0
8	R/W	XTAL16_BIAS_SAMPLE_HOLD_ENABLE	Enables I <sub>bias</sub> sample/hold function in 16 MHz crystal oscillator. This bit should be set when the system wake up and reset before entering deep or extended sleep mode.	0x0

**Table 73: CLK\_16M\_REG (0x50000022)**

Bit	Mode	Symbol	Description	Reset
7:5	R/W	XTAL16_CUR_SET	Bias current for the 16 MHz XTAL oscillator. 0x0: minimum 0x7: maximum	0x5
4:1	R/W	RC16M_TRIM	Controls the frequency of the RC16M oscillator. 0x0: lowest frequency 0xF: highest frequency	0x0
0	R/W	RC16M_ENABLE	Enables the 16 MHz RC oscillator	0x0

**Table 74: CLK\_RCX20K\_REG (0x50000024)**

Bit	Mode	Symbol	Description	Reset
12	R/W	RCX20K_SELECT	Selects RCX oscillator. 0 : RC32K oscillator 1: RCX oscillator	0
11	R/W	RCX20K_ENABLE	Enable the RCX oscillator	0
10	R/W	RCX20K_LOWF	Extra low frequency	0
9:8	R/W	RCX20K_BIAS	Bias control	1
7:4	R/W	RCX20K_NTC	Temperature control	7
3:0	R/W	RCX20K_TRIM	Controls the frequency of the RCX oscillator. 0x0: lowest frequency 0x7: default 0xF: highest frequency	8

**Table 75: BANDGAP\_REG (0x50000028)**

Bit	Mode	Symbol	Description	Reset
15	-	-	Reserved	0x0
14	R/W	BGR_LOWPOWER	Test-mode, do not use. It disables the bandgap core (voltages will continue for some time, but will slowly drift away)	0x0
13:10	R/W	LDO_RET_TRIM	(Note 35)	0x0
9:5	R/W	BGR_ITRIM	Current trimming for bias	0x0
4:0	R/W	BGR_TRIM	Trim register for bandgap	0x0

**Note 35:** 0xF is the lowest voltage, but is too low for reliable startup at high temperature in combination with extended sleep. 0xA is 100 mV higher and considered to be the lowest value which is safe to use. 0x0 or 0x1 is again 100 mV higher and 0x0 is the reset value. 0x4 is the maximum voltage.

**Table 76: ANA\_STATUS\_REG (0x5000002A)**

**Table 96: UART\_RBR\_THR\_DLL\_REG (0x50001000)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0

**Table 96: UART\_RBR\_THR\_DLL\_REG (0x50001000)**

Bit	Mode	Symbol	Description	Reset
7:0	R/W	RBR_THR_DLL	<p>Receive Buffer Register: This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an overrun error. If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost. An overrun error will also occur.</p> <p>Transmit Holding Register: This register contains data to be transmitted on the serial output port (sout) in UART mode or the serial infrared output (sir_out_n) in infrared mode. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set. If FIFO's are disabled (FCR[0] set to zero) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten. If FIFO's are enabled (FCR[0] set to one) and THRE is set, x number of characters of data may be written to the THR before the FIFO is full. The number x (default=16) is determined by the value of FIFO Depth that you set during configuration. Any attempt to write data when the FIFO is full results in the write data being lost.</p> <p>Divisor Latch (Low): This register makes up the lower 8-bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. This register may only be accessed when the DLAB bit (LCR[7]) is set. The output baud rate is equal to the serial clock (sclk) frequency divided by sixteen times the value of the baud rate divisor, as follows: <math>\text{baud rate} = (\text{serial clock freq}) / (16 * \text{divisor})</math> Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications will occur. Also, once the DLL is set, at least 8 clock cycles of the slowest DW_apb_uart clock should be allowed to pass before transmitting or receiving data.</p>	0x0

**Table 97: UART\_IER\_DLH\_REG (0x50001004)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7	R/W	PTIME_DLH7	Interrupt Enable Register: PTIME, Programmable THRE Interrupt Mode Enable. This is used to enable/disable the generation of THRE Interrupt. 0 = disabled 1 = enabled Divisor Latch (High): Bit[7] of the 8 bit DLH register.	0x0
6:4	-	-	Reserved	0x0
3	R/W	EDSSI_DLH3	Interrupt Enable Register: EDSSI, Enable Modem Status Interrupt. This is used to enable/disable the generation of Modem Status Interrupt. This is the fourth highest priority interrupt. 0 = disabled 1 = enabled Divisor Latch (High): Bit[3] of the 8 bit DLH register	0x0
2	R/W	ELSI_DHL2	Interrupt Enable Register: ELSI, Enable Receiver Line Status Interrupt. This is used to enable/disable the generation of Receiver Line Status Interrupt. This is the highest priority interrupt. 0 = disabled 1 = enabled Divisor Latch (High): Bit[2] of the 8 bit DLH register.	0x0

**Table 97: UART\_IER\_DLH\_REG (0x50001004)**

Bit	Mode	Symbol	Description	Reset
1	R/W	ETBEI_DLH1	Interrupt Enable Register: ETBEI, Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt. 0 = disabled 1 = enabled Divisor Latch (High): Bit[1] of the 8 bit DLH register.	0x0
0	R/W	ERBFI_DLH0	Interrupt Enable Register: ERBFI, Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFO's enabled). These are the second highest priority interrupts. 0 = disabled 1 = enabled Divisor Latch (High): Bit[0] of the 8 bit DLH register.	0x0

**Table 98: UART\_IIR\_FCR\_REG (0x50001008)**

Bit	Mode	Symbol	Description	Reset
15:0	R/W	IIR_FCR	Interrupt Identification Register, reading this register; FIFO Control Register, writing to this register. Interrupt Identification Register: Bits[7:6], FIFO's Enabled (or FIFOSE): This is used to indicate whether the FIFO's are enabled or disabled. 00 = disabled. 11 = enabled. Bits[3:0], Interrupt ID (or IID): This indicates the highest priority pending interrupt which can be one of the following types: 0000 = modem status. 0001 = no interrupt pending. 0010 = THR empty. 0100 = received data available. 0110 = receiver line status. 0111 = busy detect. 1100 = character timeout. Bits[7:6], RCVR Trigger (or RT):. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt will be generated. In auto flow control mode it is used to determine when the rts_n signal will be de-asserted. It also determines when the dma_rx_req_n signal will be asserted when in certain modes of operation. The following trigger levels are supported: 00 = 1 character in the FIFO 01 = FIFO 1/4 full 10 = FIFO 1/2 full 11 = FIFO 2 less than full Bits[5:4], TX Empty Trigger (or TET): This is used to select the empty threshold level at which the THRE Interrupts will be generated when the mode is active. It also determines when the dma_tx_req_n signal will be asserted when in certain modes of operation. The following trigger levels are supported: 00 = FIFO empty 01 = 2 characters in the FIFO 10 = FIFO 1/4 full 11 = FIFO 1/2 full Bit[3], DMA Mode (or DMAM): This determines the DMA signalling mode used for the dma_tx_req_n and dma_rx_req_n output signals. 0 = mode 0 1 = mode 1 Bit[2], XMIT FIFO Reset (or XFIFOR): This resets the control portion of the transmit FIFO and treats the FIFO as empty. Note that this bit is 'self-clearing' and it is not necessary to clear this bit. Bit[1], RCVR FIFO Reset (or RFIFOR): This resets the control portion of the receive FIFO and treats the FIFO as empty. Note that this bit is 'self-clearing' and it is not necessary to clear this bit. Bit[0], FIFO Enable (or FIFOE): This enables/disables the transmit (XMIT) and receive (RCVR) FIFO's. Whenever the value of this bit is changed both the XMIT and RCVR controller portion of FIFO's will be reset.	0x0

**Table 99: UART\_LCR\_REG (0x5000100C)**

7	R/W	UART_DLAB	<p>Divisor Latch Access Bit.</p> <p>This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH) to set the baud rate of the UART.</p> <p>This bit must be cleared after initial baud rate setup in order to access other registers.</p>	0x0
6	R/W	UART_BC	<p>Break Control Bit.</p> <p>This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the serial line is forced low until the Break bit is cleared. If active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.</p>	0x0
5	-	-	Reserved	0x0
4	R/W	UART_EPS	<p>Even Parity Select.</p> <p>This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic 1s is transmitted or checked. If set to zero, an odd number of logic 1s is transmitted or checked.</p>	0x0
3	R/W	UART_PEN	<p>Parity Enable.</p> <p>This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively.</p> <p>0 = parity disabled 1 = parity enabled</p>	0x0
2	R/W	UART_STOP	<p>Number of stop bits.</p> <p>This is used to select the number of stop bits per character that the peripheral transmits and receives. If set to zero, one stop bit is transmitted in the serial data.</p> <p>If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected, the receiver checks only the first stop bit.</p> <p>0 = 1 stop bit 1 = 1.5 stop bits when DLS (LCR[1:0]) is zero, else 2 stop bit</p>	0x0
1:0	R/W	UART_DLS	<p>Data Length Select.</p> <p>This is used to select the number of data bits per character that the peripheral transmits and receives. The number of bit that may be selected areas follows:</p> <p>00 = 5 bits 01 = 6 bits 10 = 7 bits 11 = 8 bits</p>	0x0

**Table 100: UART\_MCR\_REG (0x50001010)**

Bit	Mode	Symbol	Description	Reset
15:7	-	-	Reserved	0x0

**Table 100: UART\_MCR\_REG (0x50001010)**

Bit	Mode	Symbol	Description	Reset
6	R/W	UART_SIRE	<p>SIR Mode Enable. This is used to enable/disable the IrDA SIR Mode features as described in "IrDA 1.0 SIR Protocol" on page 53. 0 = IrDA SIR Mode disabled 1 = IrDA SIR Mode enabled</p>	0x0
5	R/W	UART_AFCE	<p>Auto Flow Control Enable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, hardware Auto Flow Control is enabled via CTS and RTS. 0 = Auto Flow Control Mode disabled 1 = Auto Flow Control Mode enabled</p>	0x0
4	R/W	UART_LB	<p>LoopBack Bit. This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE not active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.</p>	0x0
3	R/W	UART_OUT2	<p>OUT2. This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n, that is: 0 = out2_n de-asserted (logic 1) 1 = out2_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.</p>	0x0
2	R/W	UART_OUT1	<p>OUT1. This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n, that is: 0 = out1_n de-asserted (logic 1) 1 = out1_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.</p>	0x0

**Table 100: UART\_MCR\_REG (0x50001010)**

Bit	Mode	Symbol	Description	Reset
1	R/W	UART_RTS	<p>Request to Send.</p> <p>This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data.</p> <p>When Auto Flow Control is disabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. When Auto Flow Control is enabled (MCR[5] set to one) and FIFOs are enabled (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when MCR[1] is set low.</p> <p>Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive (high) while the value of this location is internally looped back to an input.</p>	0x0
0	-	-	Reserved	0x0

**Table 101: UART\_LSR\_REG (0x50001014)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7	R	UART_RFE	<p>Receiver FIFO Error bit.</p> <p>This bit is only relevant when FIFOs are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO.</p> <p>0 = no error in RX FIFO 1 = error in RX FIFO</p> <p>This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.</p>	0x0
6	R	UART_TEMT	<p>Transmitter Empty bit.</p> <p>If FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.</p>	0x1
5	R	UART_THRE	<p>Transmit Holding Register Empty bit.</p> <p>If THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty.</p> <p>This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting.</p>	0x1

Bit	Mode	Symbol	Description	Reset
4	R	UART_B1	<p>Break Interrupt bit.</p> <p>This is used to indicate the detection of a break sequence on the serial input data.</p> <p>If in UART mode (SIR_MODE == Disabled), it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits.</p> <p>If in infrared mode (SIR_MODE == Enabled), it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART.</p> <p>In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO.</p> <p>Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read.</p>	0x0
3	R	UART_FE	<p>Framing Error bit.</p> <p>This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data.</p> <p>In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO.</p> <p>When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]).</p> <p>0 = no framing error 1 = framing error</p> <p>Reading the LSR clears the FE bit.</p>	0x0
2	R	UART_PE	<p>Parity Error bit.</p> <p>This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set.</p> <p>In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO.</p> <p>It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]).</p> <p>0 = no parity error 1 = parity error</p> <p>Reading the LSR clears the PE bit.</p>	0x0

Bit	Mode	Symbol	Description	Reset
7:0	R/W	SRBR_STHRX	Shadow Receive Buffer Register x: This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an overrun error. If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost. An overrun error will also occur. Shadow Transmit Holding Register 0: This is a shadow register for the THR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains data to be transmitted on the serial output port (sout) in UART mode or the serial infrared output (sir_out_n) in infrared mode. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set. If FIFO's are disabled (FCR[0] set to zero) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten. If FIFO's are enabled (FCR[0] set to one) and THRE is set, x number of characters of data may be written to the THR before the FIFO is full. The number x (default=16) is determined by the value of FIFO Depth that you set during configuration. Any attempt to write data when the FIFO is full results in the write data being lost.	0x0

An overrun error will also occur. Shadow Transmit Holding Register 0: This is a shadow register for the THR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains data to be transmitted on the serial output port (sout) in UART mode or the serial infrared output (sir_out_n) in infrared mode. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set. If FIFO's are disabled (FCR[0] set to zero) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten. If FIFO's are enabled (FCR[0] set to one) and THRE is set, x number of characters of data may be written to the THR before the FIFO is full. The number x (default=16) is determined by the value of FIFO Depth that you set during configuration. Any attempt to write data when the FIFO is full results in the write data being lost.	0x0

0	R/W	UART_SHADOW_REQUEST_TO_SEND	Shadow Request to Send. This is a shadow register for the RTS bit (MCR[1]), this can be used to remove the burden of having to perform a read-modify-write on the MCR. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART Ctrl is ready to exchange data. When Auto Flow Control is disabled (MCR[5] = 0), the rts_n signal is set low by programming MCR[1] (RTS) to a high. When Auto Flow Control is enabled (MCR[5] = 1) and FIFOs are enabled (FCR[0] = 1), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). Note that in Loopback mode (MCR[4] = 1), the rts_n output is held inactive-high while the value of this location is internally looped back to an input.	0x0

**Table 127: UART\_SBCR\_REG (0x50001090)**

Bit	Mode	Symbol	Description	Reset
15:1	-	-	Reserved	0x0
0	R/W	UART_SHADOW_BREAK_CONTROL	Shadow Break Control Bit. This is a shadow register for the Break bit (LCR[6]), this can be used to remove the burden of having to performing a read modify write on the LCR. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE active (MCR[6] = 1) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver.	0x0

Bit	Mode	Symbol	Description	Reset
7:0	R/W	RBR_THR_DLL	<p>Receive Buffer Register: This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an overrun error. If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost. An overrun error will also occur.</p> <p>Transmit Holding Register: This register contains data to be transmitted on the serial output port (sout) in UART mode or the serial infrared output (sir_out_n) in infrared mode. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set. If FIFO's are disabled (FCR[0] set to zero) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten. If FIFO's are enabled (FCR[0] set to one) and THRE is set, x number of characters of data may be written to the THR before the FIFO is full. The number x (default=16) is determined by the value of FIFO Depth that you set during configuration. Any attempt to write data when the FIFO is full results in the write data being lost.</p> <p>Divisor Latch (Low): This register makes up the lower 8-bits of a 16-bit, read/write, Divisor Latch register that contains the baud rate divisor for the UART. This register may only be accessed when the DLAB bit (LCR[7]) is set. The output baud rate is equal to the serial clock (sclk) frequency divided by sixteen times the value of the baud rate divisor, as follows: <math>\text{baud rate} = (\text{serial clock freq}) / (16 * \text{divisor})</math> Note that with the Divisor Latch Registers (DLL and DLH) set to zero, the baud clock is disabled and no serial communications will occur. Also, once the DLL is set, at least 8 clock cycles of the slowest DW_apb_uart clock should be allowed to pass before transmitting or receiving data.</p>	0x0

Bit	Mode	Symbol	Description	Reset
1	R/W	ETBEI_DLH1	Interrupt Enable Register: ETBEI, Enable Transmit Holding Register Empty Interrupt. This is used to enable/disable the generation of Transmitter Holding Register Empty Interrupt. This is the third highest priority interrupt. 0 = disabled 1 = enabled Divisor Latch (High): Bit[1] of the 8 bit DLH register.	0x0
0	R/W	ERBFI_DLH0	Interrupt Enable Register: ERBFI, Enable Received Data Available Interrupt. This is used to enable/disable the generation of Received Data Available Interrupt and the Character Timeout Interrupt (if in FIFO mode and FIFO's enabled). These are the second highest priority interrupts. 0 = disabled 1 = enabled Divisor Latch (High): Bit[0] of the 8 bit DLH register.	0x0

**Table 138: UART2\_IIR\_FCR\_REG (0x50001108)**

Bit	Mode	Symbol	Description	Reset
15:0	R/W	IIR_FCR	Interrupt Identification Register, reading this register; FIFO Control Register, writing to this register. Interrupt Identification Register: Bits[7:6], FIFO's Enabled (or FIFOSE): This is used to indicate whether the FIFO's are enabled or disabled. 00 = disabled. 11 = enabled. Bits[3:0], Interrupt ID (or IID): This indicates the highest priority pending interrupt which can be one of the following types: 0000 = modem status. 0001 = no interrupt pending. 0010 = THR empty. 0100 = received data available. 0110 = receiver line status. 0111 = busy detect. 1100 = character timeout. Bits[7:6], RCVR Trigger (or RT):. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt will be generated. In auto flow control mode it is used to determine when the rts_n signal will be de-asserted. It also determines when the dma_rx_req_n signal will be asserted when in certain modes of operation. The following trigger levels are supported: 00 = 1 character in the FIFO 01 = FIFO 1/4 full 10 = FIFO 1/2 full 11 = FIFO 2 less than full Bits[5:4], TX Empty Trigger (or TET): This is used to select the empty threshold level at which the THRE Interrupts will be generated when the mode is active. It also determines when the dma_tx_req_n signal will be asserted when in certain modes of operation. The following trigger levels are supported: 00 = FIFO empty 01 = 2 characters in the FIFO 10 = FIFO 1/4 full 11 = FIFO 1/2 full Bit[3], DMA Mode (or DMAM): This determines the DMA signalling mode used for the dma_tx_req_n and dma_rx_req_n output signals. 0 = mode 0 1 = mode 1 Bit[2], XMIT FIFO Reset (or XFIFOR): This resets the control portion of the transmit FIFO and treats the FIFO as empty. Note that this bit is 'self-clearing' and it is not necessary to clear this bit. Bit[1], RCVR FIFO Reset (or RFIFOR): This resets the control portion of the receive FIFO and treats the FIFO as empty. Note that this bit is 'self-clearing' and it is not necessary to clear this bit. Bit[0], FIFO Enable (or FIFOE): This enables/disables the transmit (XMIT) and receive (RCVR) FIFO's. Whenever the value of this bit is changed both the XMIT and RCVR controller portion of FIFO's will be reset.	0x0

**Table 139: UART2\_LCR\_REG (0x5000110C)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7	R/W	UART_DLAB	<p>Divisor Latch Access Bit.</p> <p>This bit is used to enable reading and writing of the Divisor Latch register (DLL and DLH) to set the baud rate of the UART.</p> <p>This bit must be cleared after initial baud rate setup in order to access other registers.</p>	0x0
6	R/W	UART_BC	<p>Break Control Bit.</p> <p>This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the serial line is forced low until the Break bit is cleared. If active (MCR[6] set to one) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver and the sir_out_n line is forced low.</p>	0x0
5	-	-	Reserved	0x0
4	R/W	UART_EPS	<p>Even Parity Select.</p> <p>This is used to select between even and odd parity, when parity is enabled (PEN set to one). If set to one, an even number of logic 1s is transmitted or checked. If set to zero, an odd number of logic 1s is transmitted or checked.</p>	0x0
3	R/W	UART_PEN	<p>Parity Enable.</p> <p>This bit is used to enable and disable parity generation and detection in transmitted and received serial character respectively.</p> <p>0 = parity disabled 1 = parity enabled</p>	0x0
2	R/W	UART_STOP	<p>Number of stop bits.</p> <p>This is used to select the number of stop bits per character that the peripheral transmits and receives. If set to zero, one stop bit is transmitted in the serial data.</p> <p>If set to one and the data bits are set to 5 (LCR[1:0] set to zero) one and a half stop bits is transmitted. Otherwise, two stop bits are transmitted. Note that regardless of the number of stop bits selected, the receiver checks only the first stop bit.</p> <p>0 = 1 stop bit 1 = 1.5 stop bits when DLS (LCR[1:0]) is zero, else 2 stop bit</p>	0x0
1:0	R/W	UART_DLS	<p>Data Length Select.</p> <p>This is used to select the number of data bits per character that the peripheral transmits and receives. The number of bit that may be selected areas follows:</p> <p>00 = 5 bits 01 = 6 bits 10 = 7 bits 11 = 8 bits</p>	0x0

**Table 140: UART2\_MCR\_REG (0x50001110)**

Bit	Mode	Symbol	Description	Reset
15:7	-	-	Reserved	0x0

**Table 140: UART2\_MCR\_REG (0x50001110)**

Bit	Mode	Symbol	Description	Reset
6	R/W	UART_SIRE	<p>SIR Mode Enable. This is used to enable/disable the IrDA SIR Mode features as described in "IrDA 1.0 SIR Protocol" on page 53. 0 = IrDA SIR Mode disabled 1 = IrDA SIR Mode enabled</p>	0x0
5	R/W	UART_AFCE	<p>Auto Flow Control Enable. When FIFOs are enabled and the Auto Flow Control Enable (AFCE) bit is set, hardware Auto Flow Control is enabled via CTS and RTS. 0 = Auto Flow Control Mode disabled 1 = Auto Flow Control Mode enabled</p>	0x0
4	R/W	UART_LB	<p>LoopBack Bit. This is used to put the UART into a diagnostic mode for test purposes. If operating in UART mode (SIR_MODE not active, MCR[6] set to zero), data on the sout line is held high, while serial data output is looped back to the sin line, internally. In this mode all the interrupts are fully functional. Also, in loopback mode, the modem control inputs (dsr_n, cts_n, ri_n, dcd_n) are disconnected and the modem control outputs (dtr_n, rts_n, out1_n, out2_n) are looped back to the inputs, internally. If operating in infrared mode (SIR_MODE active, MCR[6] set to one), data on the sir_out_n line is held low, while serial data output is inverted and looped back to the sir_in line.</p>	0x0
3	R/W	UART_OUT2	<p>OUT2. This is used to directly control the user-designated Output2 (out2_n) output. The value written to this location is inverted and driven out on out2_n, that is: 0 = out2_n de-asserted (logic 1) 1 = out2_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out2_n output is held inactive high while the value of this location is internally looped back to an input.</p>	0x0
2	R/W	UART_OUT1	<p>OUT1. This is used to directly control the user-designated Output1 (out1_n) output. The value written to this location is inverted and driven out on out1_n, that is: 0 = out1_n de-asserted (logic 1) 1 = out1_n asserted (logic 0) Note that in Loopback mode (MCR[4] set to one), the out1_n output is held inactive high while the value of this location is internally looped back to an input.</p>	0x0

**Table 140: UART2\_MCR\_REG (0x50001110)**

Bit	Mode	Symbol	Description	Reset
1	R/W	UART_RTS	Request to Send. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART is ready to exchange data. When Auto Flow Control is disabled (MCR[5] set to zero), the rts_n signal is set low by programming MCR[1] (RTS) to a high. When Auto Flow Control is enabled (MCR[5] set to one) and FIFOs are enabled (FCR[0] set to one), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). The rts_n signal is de-asserted when MCR[1] is set low. Note that in Loopback mode (MCR[4] set to one), the rts_n output is held inactive (high) while the value of this location is internally looped back to an input.	0x0
0	-	-	Reserved	0x0

**Table 141: UART2\_LSR\_REG (0x50001114)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7	R	UART_RFE	Receiver FIFO Error bit. This bit is only relevant when FIFOs are enabled (FCR[0] set to one). This is used to indicate if there is at least one parity error, framing error, or break indication in the FIFO. 0 = no error in RX FIFO 1 = error in RX FIFO This bit is cleared when the LSR is read and the character with the error is at the top of the receiver FIFO and there are no subsequent errors in the FIFO.	0x0
6	R	UART_TEMT	Transmitter Empty bit. If FIFOs enabled (FCR[0] set to one), this bit is set whenever the Transmitter Shift Register and the FIFO are both empty. If FIFOs are disabled, this bit is set whenever the Transmitter Holding Register and the Transmitter Shift Register are both empty.	0x1
5	R	UART_THRE	Transmit Holding Register Empty bit. If THRE mode is disabled (IER[7] set to zero) and regardless of FIFO's being implemented/enabled or not, this bit indicates that the THR or TX FIFO is empty. This bit is set whenever data is transferred from the THR or TX FIFO to the transmitter shift register and no new data has been written to the THR or TX FIFO. This also causes a THRE Interrupt to occur, if the THRE Interrupt is enabled. If both modes are active (IER[7] set to one and FCR[0] set to one respectively), the functionality is switched to indicate the transmitter FIFO is full, and no longer controls THRE interrupts, which are then controlled by the FCR[5:4] threshold setting.	0x1

**Table 141: UART2\_LSR\_REG (0x50001114)**

Bit	Mode	Symbol	Description	Reset
4	R	UART_B1	<p>Break Interrupt bit.</p> <p>This is used to indicate the detection of a break sequence on the serial input data.</p> <p>If in UART mode (SIR_MODE == Disabled), it is set whenever the serial input, sin, is held in a logic '0' state for longer than the sum of start time + data bits + parity + stop bits.</p> <p>If in infrared mode (SIR_MODE == Enabled), it is set whenever the serial input, sir_in, is continuously pulsed to logic '0' for longer than the sum of start time + data bits + parity + stop bits. A break condition on serial input causes one and only one character, consisting of all zeros, to be received by the UART.</p> <p>In the FIFO mode, the character associated with the break condition is carried through the FIFO and is revealed when the character is at the top of the FIFO.</p> <p>Reading the LSR clears the BI bit. In the non-FIFO mode, the BI indication occurs immediately and persists until the LSR is read.</p>	0x0
3	R	UART_FE	<p>Framing Error bit.</p> <p>This is used to indicate the occurrence of a framing error in the receiver. A framing error occurs when the receiver does not detect a valid STOP bit in the received data.</p> <p>In the FIFO mode, since the framing error is associated with a character received, it is revealed when the character with the framing error is at the top of the FIFO.</p> <p>When a framing error occurs, the UART tries to resynchronize. It does this by assuming that the error was due to the start bit of the next character and then continues receiving the other bit i.e. data, and/or parity and stop. It should be noted that the Framing Error (FE) bit (LSR[3]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]).</p> <p>0 = no framing error 1 = framing error</p> <p>Reading the LSR clears the FE bit.</p>	0x0
2	R	UART_PE	<p>Parity Error bit.</p> <p>This is used to indicate the occurrence of a parity error in the receiver if the Parity Enable (PEN) bit (LCR[3]) is set.</p> <p>In the FIFO mode, since the parity error is associated with a character received, it is revealed when the character with the parity error arrives at the top of the FIFO.</p> <p>It should be noted that the Parity Error (PE) bit (LSR[2]) is set if a break interrupt has occurred, as indicated by Break Interrupt (BI) bit (LSR[4]).</p> <p>0 = no parity error 1 = parity error</p> <p>Reading the LSR clears the PE bit.</p>	0x0

**Table 146: UART2\_SRBR\_STHR0\_REG (0x50001130)**

Bit	Mode	Symbol	Description	Reset
7:0	R/W	SRBR_STHRX	Shadow Receive Buffer Register x: This is a shadow register for the RBR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains the data byte received on the serial input port (sin) in UART mode or the serial infrared input (sir_in) in infrared mode. The data in this register is valid only if the Data Ready (DR) bit in the Line status Register (LSR) is set. If FIFOs are disabled (FCR[0] set to zero), the data in the RBR must be read before the next data arrives, otherwise it will be overwritten, resulting in an overrun error. If FIFOs are enabled (FCR[0] set to one), this register accesses the head of the receive FIFO. If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost. An overrun error will also occur. Shadow Transmit Holding Register 0: This is a shadow register for the THR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains data to be transmitted on the serial output port (sout) in UART mode or the serial infrared output (sir_out_n) in infrared mode. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set. If FIFO's are disabled (FCR[0] set to zero) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten. If FIFO's are enabled (FCR[0] set to one) and THRE is set, x number of characters of data may be written to the THR before the FIFO is full. The number x (default=16) is determined by the value of FIFO Depth that you set during configuration. Any attempt to write data when the FIFO is full results in the write data being lost.	0x0

If the receive FIFO is full and this register is not read before the next data character arrives, then the data already in the FIFO will be preserved but any incoming data will be lost. An overrun error will also occur. Shadow Transmit Holding Register 0: This is a shadow register for the THR and has been allocated sixteen 32-bit locations so as to accommodate burst accesses from the master. This register contains data to be transmitted on the serial output port (sout) in UART mode or the serial infrared output (sir_out_n) in infrared mode. Data should only be written to the THR when the THR Empty (THRE) bit (LSR[5]) is set. If FIFO's are disabled (FCR[0] set to zero) and THRE is set, writing a single character to the THR clears the THRE. Any additional writes to the THR before the THRE is set again causes the THR data to be overwritten. If FIFO's are enabled (FCR[0] set to one) and THRE is set, x number of characters of data may be written to the THR before the FIFO is full. The number x (default=16) is determined by the value of FIFO Depth that you set during configuration. Any attempt to write data when the FIFO is full results in the write data being lost.	0x0

2	W	UART_XFR	XMIT FIFO Reset. This is a shadow register for the XMIT FIFO Reset bit (FCR[2]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the transmit FIFO. This resets the control portion of the transmit FIFO and treats the FIFO as empty. Note that this bit is 'self-clearing'. It is not necessary to clear this bit.	0x0
1	W	UART_RFR	RCVR FIFO Reset. This is a shadow register for the RCVR FIFO Reset bit (FCR[1]). This can be used to remove the burden on software having to store previously written FCR values (which are pretty static) just to reset the receive FIFO. This resets the control portion of the receive FIFO and treats the FIFO as empty. Note that this bit is 'self-clearing'. It is not necessary to clear this bit.	0x0
0	W	UART_UR	UART Reset. This asynchronously resets the UART Ctrl and synchronously removes the reset assertion. For a two clock implementation both pclk and sclk domains are reset.	0x0

**Table 166: UART2\_SRTS\_REG (0x5000118C)**

Bit	Mode	Symbol	Description	Reset

**Table 166: UART2\_SRTS\_REG (0x5000118C)**

Bit	Mode	Symbol	Description	Reset
0	R/W	UART_SHADOW_REQUEST_TO_SEND	Shadow Request to Send. This is a shadow register for the RTS bit (MCR[1]), this can be used to remove the burden of having to perform a read-modify-write on the MCR. This is used to directly control the Request to Send (rts_n) output. The Request To Send (rts_n) output is used to inform the modem or data set that the UART Ctrl is ready to exchange data. When Auto Flow Control is disabled (MCR[5] = 0), the rts_n signal is set low by programming MCR[1] (RTS) to a high. When Auto Flow Control is enabled (MCR[5] = 1) and FIFOs are enabled (FCR[0] = 1), the rts_n output is controlled in the same way, but is also gated with the receiver FIFO threshold trigger (rts_n is inactive high when above the threshold). Note that in Loopback mode (MCR[4] = 1), the rts_n output is held inactive-high while the value of this location is internally looped back to an input.	0x0

**Table 167: UART2\_SBCR\_REG (0x50001190)**

Bit	Mode	Symbol	Description	Reset
15:1	-	-	Reserved	0x0
0	R/W	UART_SHADOW_BREAK_CONTROL	Shadow Break Control Bit. This is a shadow register for the Break bit (LCR[6]), this can be used to remove the burden of having to performing a read modify write on the LCR. This is used to cause a break condition to be transmitted to the receiving device. If set to one the serial output is forced to the spacing (logic 0) state. When not in Loopback Mode, as determined by MCR[4], the sout line is forced low until the Break bit is cleared. If SIR_MODE active (MCR[6] = 1) the sir_out_n line is continuously pulsed. When in Loopback Mode, the break condition is internally looped back to the receiver.	0x0

**Table 168: UART2\_SDMAM\_REG (0x50001194)**

Bit	Mode	Symbol	Description	Reset
15:1	-	-	Reserved	0x0
0	R/W	UART_SHADOW_DMA_MODE	Shadow DMA Mode. This is a shadow register for the DMA mode bit (FCR[3]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the DMA Mode bit gets updated. This determines the DMA signalling mode used for the dma_tx_req_n and dma_rx_req_n output signals. 0 = mode 0 1 = mode 1	0x0

**Table 169: UART2\_SFE\_REG (0x50001198)**

Bit	Mode	Symbol	Description	Reset
0	R/W	UART_SHADOW_FIFO_ENABLE	Shadow FIFO Enable. This is a shadow register for the FIFO enable bit (FCR[0]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the FIFO enable bit gets updated. This enables/disables the transmit (XMIT) and receive (RCVR) FIFOs. If this bit is set to zero (disabled) after being enabled then both the XMIT and RCVR controller portion of FIFOs are reset.	0x0

**Table 170: UART2\_SRT\_REG (0x5000119C)**

Bit	Mode	Symbol	Description	Reset
15:2	-	-	Reserved	0x0
1:0	R/W	UART_SHADOW_RCVR_TRIGGER	Shadow RCVR Trigger. This is a shadow register for the RCVR trigger bits (FCR[7:6]). This can be used to remove the burden of having to store the previously written value to the FCR in memory and having to mask this value so that only the RCVR trigger bit gets updated. This is used to select the trigger level in the receiver FIFO at which the Received Data Available Interrupt is generated. It also determines when the dma_rx_req_n signal is asserted when DMA Mode (FCR[3]) = 1. The following trigger levels are supported: 00 = 1 character in the FIFO 01 = FIFO ¼ full 10 = FIFO ½ full 11 = FIFO 2 less than full	0x0

**Table 180: SPI\_CTRL\_REG1 (0x50001208)**

Bit	Mode	Symbol	Description	Reset
3	R	SPI_BUSY	0 = The SPI is not busy with a transfer. This means that either no TX-data is available or that the transfers have been suspended due to a full RX-FIFO. The SPIx_CTRL_REG0[SPI_INT_BIT] can be used to distinguish between these situations. 1 = The SPI is busy with a transfer.	0x0
2	R/W	SPI_PRIORITY	0 = The SPI has low priority, the DMA request signals are reset after the corresponding acknowledge. 1 = The SPI has high priority, DMA request signals remain active until the FIFOs are filled/emptied, so the DMA holds the AHB bus.	0x0
1:0	R/W	SPI_FIFO_MODE	0: TX-FIFO and RX-FIFO used (Bidirectional mode). 1: RX-FIFO used (Read Only Mode) TX-FIFO single depth, no flow control 2: TX-FIFO used (Write Only Mode), RX-FIFO single depth, no flow control 3: No FIFOs used (backwards compatible mode)	0x3

**Table 181: I2C\_CON\_REG (0x50001300)**

Bit	Mode	Symbol	Description	Reset
15:7	-	-	Reserved	0x0
6	R/W	I2C_SLAVE_DISABLE	Slave enabled or disabled after reset is applied, which means software does not have to configure the slave. 0=slave is enabled 1=slave is disabled Software should ensure that if this bit is written with '0', then bit 0 should also be written with a '0'.	0x1
5	R/W	I2C_RESTART_EN	Determines whether RESTART conditions may be sent when acting as a master 0= disable 1=enable	0x1
4	R/W	I2C_10BITADDR_MASTER	Controls whether the controller starts its transfers in 7- or 10-bit addressing mode when acting as a master. 0= 7-bit addressing 1= 10-bit addressing	0x1
3	R/W	I2C_10BITADDR_SLAVE	When acting as a slave, this bit controls whether the controller responds to 7- or 10-bit addresses. 0= 7-bit addressing 1= 10-bit addressing	0x1
2:1	R/W	I2C_SPEED	These bits control at which speed the controller operates. 1= standard mode (100 kbit/s) 2= fast mode (400 kbit/s)	0x2
0	R/W	I2C_MASTER_MODE	This bit controls whether the controller master is enabled. 0= master disabled 1= master enabled Software should ensure that if this bit is written with '1' then bit 6 should also be written with a '1'.	0x1

**Table 182: I2C\_TAR\_REG (0x50001304)**

Bit	Mode	Symbol	Description	Reset
15:12	-	-	Reserved	0x0

**Table 182: I2C\_TAR\_REG (0x50001304)**

Bit	Mode	Symbol	Description	Reset
11	R/W	SPECIAL	This bit indicates whether software performs a General Call or START BYTE command. 0: ignore bit 10 GC_OR_START and use IC_TAR normally 1: perform special I2C command as specified in GC_OR_START bit	0x0
10	R/W	GC_OR_START	If bit 11 (SPECIAL) is set to 1, then this bit indicates whether a General Call or START byte command is to be performed by the controller. 0: General Call Address - after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The controller remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. 1: START BYTE	0x0
9:0	R/W	IC_TAR	This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits. Note: If the IC_TAR and IC_SAR are the same, loopback exists but the FIFOs are shared between master and slave, so full loopback is not feasible. Only one direction loopback mode is supported (simplex), not duplex. A master cannot transmit to itself; it can transmit to only a slave	0x55

**Table 183: I2C\_SAR\_REG (0x50001308)**

Bit	Mode	Symbol	Description	Reset
15:10	-	-	Reserved	0x0
9:0	R/W	IC_SAR	The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.	0x55

**Table 184: I2C\_DATA\_CMD\_REG (0x50001310)**

Bit	Mode	Symbol	Description	Reset
15:9	-	-	Reserved	0x0

**Table 184: I2C\_DATA\_CMD\_REG (0x50001310)**

Bit	Mode	Symbol	Description	Reset
8	R/W	CMD	<p>This bit controls whether a read or a write is performed. This bit does not control the direction when the I2C Ctrl acts as a slave. It controls only the direction when it acts as a master.</p> <p>1 = Read 0 = Write</p> <p>When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a "don't care" because writes to this register are not required. In slave-transmitter mode, a "0" indicates that CPU data is to be transmitted and as DAT or IC_DATA_CMD[7:0]. When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the I2C_RAW_INTR_STAT_REG), unless bit 11 (SPECIAL) in the I2C_TAR register has been cleared.</p> <p>If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.</p> <p>NOTE: It is possible that while attempting a master I2C read transfer on the controller, a RD_REQ interrupt may have occurred simultaneously due to a remote I2C master addressing the controller. In this type of scenario, it ignores the I2C_DATA_CMD write, generates a TX_ABRT interrupt, and waits to service the RD_REQ interrupt</p>	0x0
7:0	R/W	DAT	<p>This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the controller. However, when you read this register, these bits return the value of data received on the controller's interface.</p>	0x0

**Table 185: I2C\_SS\_SCL\_HCNT\_REG (0x50001314)**

Bit	Mode	Symbol	Description	Reset
15:0	R/W	IC_SS_SCL_HCNT	<p>This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.</p> <p>The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set.</p> <p>NOTE: This register must not be programmed to a value higher than 65525, because the controller uses a 16-bit counter to flag an I2C bus idle condition when this counter reaches a value of IC_SS_SCL_HCNT + 10.</p>	0x48

**Table 186: I2C\_SS\_SCL\_LCNT\_REG (0x50001318)**

Bit	Mode	Symbol	Description	Reset
15:0	R/W	IC_SS_SCL_LCNT	This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock low period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the I2C_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and if attempted, results in 8 being set.	0x4F

**Table 187: I2C\_FS\_SCL\_HCNT\_REG (0x5000131C)**

Bit	Mode	Symbol	Description	Reset
15:0	R/W	IC_FS_SCL_HCNT	This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. This register can be written only when the I2C interface is disabled, which corresponds to the I2C_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 6; hardware prevents values less than this being written, and if attempted results in 6 being set.	0x8

**Table 188: I2C\_FS\_SCL\_LCNT\_REG (0x50001320)**

Bit	Mode	Symbol	Description	Reset
15:0	R/W	IC_FS_SCL_LCNT	This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock low-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL. This register can be written only when the I2C interface is disabled, which corresponds to the I2C_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 8; hardware prevents values less than this being written, and if attempted results in 8 being set. For designs with APB_DATA_WIDTH = 8 the order of programming is important to ensure the correct operation of the controller. The lower byte must be programmed first. Then the upper byte is programmed.	0x17

**Table 189: I2C\_INTR\_STAT\_REG (0x5000132C)**

Bit	Mode	Symbol	Description	Reset
15:12	-	-	Reserved	0x0
11	R	R_GEN_CALL	Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling controller or when the CPU reads bit 0 of the I2C_CLR_GEN_CALL register. The controller stores the received data in the Rx buffer.	0x0
10	R	R_START_DET	Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether controller is operating in slave or master mode.	0x0
9	R	R_STOP_DET	Indicates whether a STOP condition has occurred on the I2C interface regardless of whether controller is operating in slave or master mode.	0x0

**Table 189: I2C\_INTR\_STAT\_REG (0x5000132C)**

Bit	Mode	Symbol	Description	Reset
8	R	R_ACTIVITY	This bit captures I2C Ctrl activity and stays set until it is cleared. There are four ways to clear it: => Disabling the I2C Ctrl => Reading the IC_CLR_ACTIVITY register => Reading the IC_CLR_INTR register => System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the controller module is idle, this bit remains set until cleared, indicating that there was activity on the bus.	0x0
7	R	R_RX_DONE	When the controller is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.	0x0
6	R	R_TX_ABRT	This bit indicates if the controller, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a "transmit abort". When this bit is set to 1, the I2C_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. NOTE: The controller flushes/resets/empties the TX FIFO whenever this bit is set. The TX FIFO remains in this flushed state until the register I2C_CLR_TX_ABRT is read. Once this read is performed, the TX FIFO is then ready to accept more data bytes from the APB interface.	0x0
5	R	R_RD_REQ	This bit is set to 1 when the controller is acting as a slave and another I2C master is attempting to read data from the controller. The controller holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the I2C_DATA_CMD register. This bit is set to 0 just after the processor reads the I2C_CLR_RD_REQ register	0x0
4	R	R_TX_EMPTY	This bit is set to 1 when the transmit buffer is at or below the threshold value set in the I2C_TX_TL register. It is automatically cleared by hardware when the buffer level goes above the threshold. When the IC_ENABLE bit 0 is 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer activity, then with ic_en=0, this bit is set to 0.	0x0
3	R	R_TX_OVER	Set during transmit if the transmit buffer is filled to 32 and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared	0x0
2	R	R_RX_FULL	Set when the receive buffer reaches or goes above the RX_TL threshold in the I2C_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (I2C_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the I2C_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.	0x0

**Table 189: I2C\_INTR\_STAT\_REG (0x5000132C)**

Bit	Mode	Symbol	Description	Reset
1	R	R_RX_OVER	Set if the receive buffer is completely filled to 32 and an additional byte is received from an external I2C device. The controller acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (I2C_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.	0x0
0	R	R_RX_UNDER	Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (I2C_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.	0x0

**Table 190: I2C\_INTR\_MASK\_REG (0x50001330)**

Bit	Mode	Symbol	Description	Reset

8	R	ACTIVITY	This bit captures I2C Ctrl activity and stays set until it is cleared. There are four ways to clear it: => Disabling the I2C Ctrl => Reading the IC_CLR_ACTIVITY register => Reading the IC_CLR_INTR register => System reset Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the controller module is idle, this bit remains set until cleared, indicating that there was activity on the bus.	0x0
7	R	RX_DONE	When the controller is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.	0x0
6	R	TX_ABRT	This bit indicates if the controller, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a "transmit abort". When this bit is set to 1, the I2C_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. NOTE: The controller flushes/resets/empties the TX FIFO whenever this bit is set. The TX FIFO remains in this flushed state until the register I2C_CLR_TX_ABRT is read. Once this read is performed, the TX FIFO is then ready to accept more data bytes from the APB interface.	0x0
5	R	RD_REQ	This bit is set to 1 when I2C Ctrl is acting as a slave and another I2C master is attempting to read data from the controller. The controller holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred. The processor must respond to this interrupt and then write the requested data to the I2C_DATA_CMD register. This bit is set to 0 just after the processor reads the I2C_CLR_RD_REQ register	0x0
4	R	TX_EMPTY	This bit is set to 1 when the transmit buffer is at or below the threshold value set in the I2C_TX_TL register. It is automatically cleared by hardware when the buffer level goes above the threshold. When the IC_ENABLE bit 0 is 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines. When there is no longer activity, then with ic_en=0, this bit is set to 0.	0x0
3	R	TX_OVER	Set during transmit if the transmit buffer is filled to 32 and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared	0x0

**Table 191: I2C\_RAW\_INTR\_STAT\_REG (0x50001334)**

Bit	Mode	Symbol	Description	Reset
2	R	RX_FULL	Set when the receive buffer reaches or goes above the RX_TL threshold in the I2C_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (I2C_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the I2C_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.	0x0
1	R	RX_OVER	Set if the receive buffer is completely filled to 32 and an additional byte is received from an external I2C device. The controller acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (I2C_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.	0x0
0	R	RX_UNDER	Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (I2C_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.	0x0

**Table 192: I2C\_RX\_TL\_REG (0x50001338)**

Bit	Mode	Symbol	Description	Reset
15:5	-	-	Reserved	0x0
4:0	R/W	RX_TL	Receive FIFO Threshold Level Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in I2C_RAW_INTR_STAT register). The valid range is 0-31, with the additional restriction that hardware does not allow this value to be set to a value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 1 entry, and a value of 31 sets the threshold for 32 entries.	0x0

**Table 193: I2C\_TX\_TL\_REG (0x5000133C)**

Bit	Mode	Symbol	Description	Reset
15:5	-	-	Reserved	0x0
4:0	R/W	RX_TL	Transmit FIFO Threshold Level Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in I2C_RAW_INTR_STAT register). The valid range is 0-31, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 31 sets the threshold for 32 entries..	0x0

Bit	Mode	Symbol	Description	Reset
15:0	R/W	IC_SDA_HOLD	SDA Hold time	0x1

**Table 210: I2C\_TX\_ABRT\_SOURCE\_REG (0x50001380)**

Bit	Mode	Symbol	Description	Reset
15	R	ABRT_SLVRD_INTX	1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user writes a 1 in CMD (bit 8) of 2IC_DATA_CMD register	0x0
14	R	ABRT_SLV_ARBLOST	1: Slave lost the bus while transmitting data to a remote master. I2C_TX_ABRT_SOURCE[12] is set at the same time. Note: Even though the slave never "owns" the bus, something could go wrong on the bus. This is a fail safe check. For instance, during a data transmission at the low-to-high transition of SCL, if what is on the data bus is not what is supposed to be transmitted, then the controller no longer own the bus.	0x0
13	R	ABRT_SLVFLUSH_TX_FIFO	1: Slave has received a read command and some data exists in the TX FIFO so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO.	0x0
12	R	ARB_LOST	1: Master has lost arbitration, or if I2C_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration. Note: I2C can be both master and slave at the same time.	0x0
11	R	ABRT_MASTER_DIS	1: User tries to initiate a Master operation with the Master mode disabled.	0x0
10	R	ABRT_10B_RD_NORSTRT	1: The restart is disabled (IC_RESTART_EN bit (I2C_CON[5]) = 0) and the master sends a read command in 10-bit addressing mode.	0x0

**Table 210: I2C\_TX\_ABRT\_SOURCE\_REG (0x50001380)**

Bit	Mode	Symbol	Description	Reset
9	R	ABRT_SBYTE_NORSTR	To clear Bit 9, the source of the ABRT_SBYTE_NORSTR must be fixed first; restart must be enabled (I2C_CON[5]=1), the SPECIAL bit must be cleared (I2C_TAR[11]), or the GC_OR_START bit must be cleared (I2C_TAR[10]). Once the source of the ABRT_SBYTE_NORSTR is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTR is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets re-asserted. 1: The restart is disabled (IC_RESTART_EN bit (I2C_CON[5]) = 0) and the user is trying to send a START Byte.	0x0
8	R	ABRT_HS_NORSTR	1: The restart is disabled (IC_RESTART_EN bit (I2C_CON[5]) = 0) and the user is trying to use the master to transfer data in High Speed mode	0x0
7	R	ABRT_SBYTE_ACKDET	1: Master has sent a START Byte and the START Byte was acknowledged (wrong behavior).	0x0
6	R	ABRT_HS_ACKDET	1: Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior).	0x0
5	R	ABRT_GCALL_READ	1: the controller in master mode sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1).	0x0
4	R	ABRT_GCALL_NOACK	1: the controller in master mode sent a General Call and no slave on the bus acknowledged the General Call.	0x0
3	R	ABRT_TXDATA_NOACK	1: This is a master-mode only bit. Master has received an acknowledgement for the address, but when it sent data byte(s) following the address, it did not receive an acknowledgement from the remote slave(s).	0x0
2	R	ABRT_10ADDR2_NOACK	1: Master is in 10-bit address mode and the second address byte of the 10-bit address was not acknowledged by any slave.	0x0
1	R	ABRT_10ADDR1_NOACK	1: Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave.	0x0
0	R	ABRT_7B_ADDR_NOACK	1: Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave.	0x0

**Table 211: I2C\_SDA\_SETUP\_REG (0x50001394)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7:0	R/W	SDA_SETUP	SDA Setup. This register controls the amount of time delay (number of I2C clock periods) between the rising edge of SCL and SDA changing by holding SCL low when I2C block services a read request while operating as a slave-transmitter. The relevant I2C requirement is tSU:DAT (note 4) as detailed in the I2C Bus Specification. This register must be programmed with a value equal to or greater than 2. It is recommended that if the required delay is 1000ns, then for an I2C frequency of 10 MHz, IC_SDA_SETUP should be programmed to a value of 11. Writes to this register succeed only when IC_ENABLE[0] = 0.	0x64

**Table 212: I2C\_ACK\_GENERAL\_CALL\_REG (0x50001398)**

Bit	Mode	Symbol	Description	Reset
15:1	-	-	Reserved	0x0
0	R/W	ACK_GEN_CALL	ACK General Call. When set to 1, I2C Ctrl responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the controller does not generate General Call interrupts.	0x0

**Table 213: I2C\_ENABLE\_STATUS\_REG (0x5000139C)**

Bit	Mode	Symbol	Description	Reset
15:3	-	-	Reserved	0x0
2	R	SLV_RX_DATA_LOST	Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting of IC_ENABLE from 1 to 0. When read as 1, the controller is deemed to have been actively engaged in an aborted I2C transfer (with matching address) and the data phase of the I2C transfer has been entered, even though a data byte has been responded with a NACK. NOTE: If the remote I2C master terminates the transfer with a STOP condition before the controller has a chance to NACK a transfer, and IC_ENABLE has been set to 0, then this bit is also set to 1. When read as 0, the controller is deemed to have been disabled without being actively involved in the data phase of a Slave-Receiver transfer. NOTE: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.	0x0
1	R	SLV_DISABLED_WHILE_BUSY	Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) I2C Ctrl is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master. When read as 1, the controller is deemed to have forced a NACK during any part of an I2C transfer, irrespective of whether the I2C address matches the slave address set in I2C Ctrl (IC_SAR register) OR if the transfer is completed before IC_ENABLE is set to 0 but has not taken effect. NOTE: If the remote I2C master terminates the transfer with a STOP condition before the the controller has a chance to NACK a transfer, and IC_ENABLE has been set to 0, then this bit will also be set to 1. When read as 0, the controller is deemed to have been disabled when there is master activity, or when the I2C bus is idle. NOTE: The CPU can safely read this bit when IC_EN (bit 0) is read as 0.	0x0

**Table 213: I2C\_ENABLE\_STATUS\_REG (0x5000139C)**

Bit	Mode	Symbol	Description	Reset
0	R	IC_EN	ic_en Status. This bit always reflects the value driven on the output port ic_en. When read as 1, the controller is deemed to be in an enabled state. When read as 0, the controller is deemed completely inactive. NOTE: The CPU can safely read this bit anytime. When this bit is read as 0, the CPU can safely read SLV_RX_DATA_LOST (bit 2) and SLV_DISABLED_WHILE_BUSY (bit 1).	0x0

**Table 214: I2C\_IC\_FS\_SPKLEN\_REG (0x500013A0)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7:0	R/W	IC_FS_SPKLEN	This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that will be filtered out by the spike suppression logic. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 2; hardware prevents values less than this being written, and if attempted results in 2 being set.	0x1

**Table 226: GP\_ADC\_CTRL\_REG (0x50001500)**

Bit	Mode	Symbol	Description	Reset
15	R/W	GP_ADC_LDO_ZERO	Forces LDO-output to 0V.	0x0
14	R/W	GP_ADC_LDO_EN	Turns on LDO.	0x0
13	R/W	GP_ADC_CHOP	Takes two samples with opposite GP_ADC_SIGN to cancel the internal offset voltage of the ADC; Highly recommended for DC-measurements.	0x0
12	R/W	GP_ADC_MUTE	Takes sample at mid-scale (to determine the internal offset and/or noise of the ADC with regards to VDD_REF which is also sampled by the ADC).	0x0
11	R/W	GP_ADC_SE	0 = Differential mode 1 = Single ended mode	0x0
10	R/W	GP_ADC_SIGN	0 = Default 1 = Conversion with opposite sign at input and output to cancel out the internal offset of the ADC and low-frequency	0x0
9:6	R/W	GP_ADC_SEL	ADC input selection which must be set before the GP_ADC_START bit is enabled. If GP_ADC_SE = 1 (single ended mode): 0000 = P0[0] 0001 = P0[1] 0010 = P0[2] 0011 = P0[3] 0100 = AVS 0101 = VDD_REF 0110 = VDD_RTT 0111 = VBAT3V 1000 = VDCDC 1001 = VBAT1V All other combinations are reserved. If GP_ADC_SE = 0 (differential mode): 0000 = P0[0] vs P0[1] All other combinations are P0[2] vs P0[3].	0x0
5	R/W	GP_ADC_MINT	0 = Disable (mask) GP_ADC_INT. 1 = Enable GP_ADC_INT to ICU.	0x0
4	R	GP_ADC_INT	1 = AD conversion ready and has generated an interrupt. Must be cleared by writing any value to GP_ADC_CLEAR_INT_REG.	0x0
3	R/W	GP_ADC_CLK_SEL	0 = Internal high-speed ADC clock used. 1 = Digital clock used.	0x0
2	-	GP_ADC_TEST	Reserved, keep 0.	0x0

**Table 226: GP\_ADC\_CTRL\_REG (0x50001500)**

Bit	Mode	Symbol	Description	Reset
1	R/W	GP_ADC_START	0 = ADC conversion ready. 1 = If a 1 is written, the ADC starts a conversion. After the conversion this bit will be set to 0 and the GP_ADC_INT bit will be set.	0x0
0	R/W	GP_ADC_EN	0 = ADC is disabled and in reset. 1 = ADC is enabled and sampling of input is started.	0x0

**Table 227: GP\_ADC\_CTRL2\_REG (0x50001502)**

Bit	Mode	Symbol	Description	Reset
15:4	-	-	Reserved	0x0
3	R/W	GP_ADC_I20U	Adds 20uA constant load current at the ADC LDO to minimize ripple on the reference voltage of the ADC.	0x0
2	R/W	GP_ADC_IDYN	Enables dynamic load current at the ADC LDO to minimize ripple on the reference voltage of the ADC.	0x0
1	R/W	GP_ADC_ATTN3X	0 = Input voltages up to 1.2V allowed. 1 = Input voltages up to 3.6V allowed by enabling 3x attenuator.	0x0
0	R/W	GP_ADC_DELAY_EN	Enables delay function for several signals. This is not auto-cleared. Toggle this bit before every sampling to enable successive conversions.	0x0

**Table 228: GP\_ADC\_OFFP\_REG (0x50001504)**

Bit	Mode	Symbol	Description	Reset
15:10	-	-	Reserved	0x0
9:0	R/W	GP_ADC_OFFP	Offset adjust of 'positive' array of ADC-network (effective if "GP_ADC_SE=0", or "GP_ADC_SE=1 AND GP_ADC_SIGN=0")	0x200

**Table 229: GP\_ADC\_OFFN\_REG (0x50001506)**

Bit	Mode	Symbol	Description	Reset
15:10	-	-	Reserved	0x0
9:0	R/W	GP_ADC_OFFN	Offset adjust of 'negative' array of ADC-network (effective if "GP_ADC_SE=0", or "GP_ADC_SE=1 AND GP_ADC_SIGN=1")	0x200

**Table 230: GP\_ADC\_CLEAR\_INT\_REG (0x50001508)**

Bit	Mode	Symbol	Description	Reset
15:0	R0/W	GP_ADC_CLR_INT	Writing any value to this register will clear the ADC_INT interrupt. Reading returns 0.	0x0

**Table 231: GP\_ADC\_RESULT\_REG (0x5000150A)**

Bit	Mode	Symbol	Description	Reset
15:10	-	-	Reserved	0x0
9:0	R	GP_ADC_VAL	Returns the 10 bits linear value of the last AD conversion.	0x0

**Table 232: GP\_ADC\_DELAY\_REG (0x5000150C)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7:0	R/W	DEL_LDO_EN	Defines the delay before the LDO enable (GP_ADC_LDO_EN). Reset value is 0 $\mu$ s since the LDO enable should be the first thing to be programmed in the sequence of bringing the GP ADC up.	0x0

**Table 233: GP\_ADC\_DELAY2\_REG (0x5000150E)**

Bit	Mode	Symbol	Description	Reset
15:8	R/W	DEL_ADC_START	Defines the delay for the GP_ADC_START bit. Reset value is 17 $\mu$ s which is the recommended value to wait before starting the GP ADC. This is the third and last step of bringing up the GP ADC	0x88
7:0	R/W	DEL_ADC_EN	Defines the delay for the GP_ADC_EN bit. Reset value is 16 $\mu$ s which is the recommended value to wait after enabling the LDO. This is the second step in bringing up the GP ADC.	0x80

**Table 234: CLK\_REF\_SEL\_REG (0x50001600)**

Bit	Mode	Symbol	Description	Reset
15:3	-	-	Reserved	0x0
2	R/W	REF_CAL_START	Writing a '1' starts a calibration. This bit is cleared when calibration is finished, and CLK_REF_VAL is ready.	0x0
1:0	R/W	REF_CLK_SEL	Select clock input for calibration: 0x0 : RC32KHz oscillator  0x1 : RC16MHz oscillator  0x2 : XTAL32KHz oscillator  0x3 : RCX32KHz oscillator	0x0

**Table 235: CLK\_REF\_CNT\_REG (0x50001602)**

Bit	Mode	Symbol	Description	Reset
15:0	R/W	REF_CNT_VAL	Indicates the calibration time, with a decrement counter to 1.	0x0

**Table 236: CLK\_REF\_VAL\_L\_REG (0x50001604)**

Bit	Mode	Symbol	Description	Reset
15:0	R	XTAL_CNT_VAL	Returns the lower 16 bits of XTAL16 clock cycles during the calibration time, defined with REF_CNT_VAL	0x0

**Table 237: CLK\_REF\_VAL\_H\_REG (0x50001606)**

Bit	Mode	Symbol	Description	Reset
15:0	R	XTAL_CNT_VAL	Returns the upper 16 bits of XTAL16 clock cycles during the calibration time, defined with REF_CNT_VAL	0x0

**Table 238: P0\_DATA\_REG (0x50003000)**

Bit	Mode	Symbol	Description	Reset

13:0	R/W	DUTY_CYCLE	duty cycle for PWM	0x0

**Table 309: TRIPLE\_PWM\_FREQUENCY (0x5000340E)**

Bit	Mode	Symbol	Description	Reset
13:0	R/W	FREQ	Freq for PWM 2 3 4	0x0

**Table 310: TRIPLE\_PWM\_CTRL\_REG (0x50003410)**

Bit	Mode	Symbol	Description	Reset
2	R/W	HW_PAUSE_EN	'1' = HW can pause PWM 2,3,4	0x1
1	R/W	SW_PAUSE_EN	'1' = PWM 2 3 4 is paused	0x0
0	R/W	TRIPLE_PWM_ENABLE	'1' = PWM 2 3 4 is enabled	0x0

## 6.1 CODEC REGISTER FILE

**Table 311: Register map Codec**

Address	Port	Description
0x00001200	ENV_REG	Test environment register
0x00001202	TEST_CTRL_REG	Test control register
0x00001210	BANDGAP_REG	Bandgap register
0x00001212	BAT_CTRL_REG	Power control register
0x00001220	GPIO_DATA_REG	GPIO Data input /out register
0x00001222	GPIO_SET_DATA_REG	GPIO Set port pins register
0x00001224	GPIO_RESET_DATA_REG	GPIO Reset port pins register
0x00001226	GPIO_DIR_REG	GPIO Direction register
0x0000122A	GPIO_PUPD_REG	GPIO Pull-up pull-down register
0x00001250	DMA0_A_STARTL_REG	Start address Low A of DMA channel 0
0x00001254	DMA0_A_IDX_REG	DMA Receive index A of channel 0
0x00001256	DMA0_B_STARTL_REG	Start address Low B of DMA channel 0
0x0000125A	DMA0_B_IDX_REG	DMA Receive B index channel 0
0x0000125E	DMA0_LEN_REG	DMA receive length register channel 0
0x00001260	DMA0_CTRL_REG	Control register for the DMA channel 0
0x00001280	CODEC_MIC_REG	Codec microphone control register
0x00001282	CODEC_LSR_REG	Codec loudspeaker control register
0x00001284	CODEC_VREF_REG	Codec vref control register
0x00001286	CODEC_IN_OUT_REG	CODEC input/output register
0x00001288	CODEC_ADDA_REG	Codec ad/da control register
0x0000128A	CODEC_OFFSET1_REG	Codec offset error and compensation register
0x0000128C	CODEC_TEST_CTRL_REG	Codec test control register codec
0x0000128E	CODEC_OFFSET2_REG	Codec offset compensation register
0x000012E2	CLK_CTRL_REG	PLL control register
0x000012E4	PLL_DIV_REG	PLL control register
0x000012E6	PER_DIV_REG	Peripheral divider register
0x000012E8	CODEC_DIV_REG	Codec divider register
0x000012FA	VERSION_REG0	Version register 0
0x000012FB	VERSION_REG1	Version register 1
0x000012FC	VERSION_REG2	Version register 2
0x000012FD	VERSION_REG3	Version register 3
0x000012FE	VERSION_REG4	Version register 4
0x000012FF	VERSION_REG5	Version register 5

**Table 312: ENV\_REG (0x00001200)**

Bit	Mode	Symbol	Description	Reset
15:4	-	-	Reserved	0x0
3:0	R	ENV_DATA	Value of pins GPIO[3-2] on rising edge of RSTn. Used for test purposes Bitfields [1-0] are reserved	0x0

**Table 313: TEST\_CTRL\_REG (0x00001202)**

Bit	Mode	Symbol	Description	Reset
15:0	R/W	TEST_CTRL	For test purpose only. Must be all 0 for normal operation	0x0

**Table 314: BANDGAP\_REG (0x00001210)**

Bit	Mode	Symbol	Description	Reset
15:12	-	-	Reserved	0x0
11:10	R	BG_COMP	Bandgap Trim comparator output (see also chapter "Bandgap reference") (valid when BG_COMP_PD = '0') 11: Bandgap voltage is to high (relative to VDD) 01: Bandgap voltage is OK (relative to VDD) 00: Bandgap voltage is to low (relative to VDD)	0x0
9	R/W	BG_COMP_PD	'0': Enable bandgap trim comparators '1': Bandgap trim comparators in power-down.	0x0
8:6	R/W	BANDGAP_I	Internal reference current adjust. Since the internal reference current can not be measured by the customer, these bits shall not be changed. Setting these bits will not affect the bandgap voltage. 1.00: + 40 % 1.01: + 30 % 1.10: + 20 % 1.11: + 10 % 0.00: + 0 % <- prescribed value if no current tuning done 0.01: - 10 % 0.10: - 20 % 0.11: - 30 %	0x0
5:4	R/W	BANDGAP_VIT	1x: Voltage and current -5.6 % <- for test purposes only x1: Voltage and current +5.6 % <- for test purposes only	0x0
3:0	R/W	BANDGAP_VI	Bandgap reference voltage and current adjust to trim internal bandgap. The correct value of the bandgap can be checked with BG_COMP if BG_COMP_PD=0. These bits must be set before the current bits 8-6 because it affects the reference currents. 0000: -5.6 % 0001: -4.9% 0010: -4.2 % 0011: -3.5 % 0100: -2.8 % 0101: -2.1 % 0110: -1.4 % 0111: -0.7 % 1000: midlevel 1001: +0.7 % 1010: +1.4 % 1011: +2.1 % 1100: +2.8 % 1101: +3.5 % 1110: +4.2 %	0x8

**Table 315: BAT\_CTRL\_REG (0x00001212)**

Bit	Mode	Symbol	Description	Reset
15:2	-	-	Reserved	0x0

**Table 315: BAT\_CTRL\_REG (0x00001212)**

Bit	Mode	Symbol	Description	Reset
1:0	R/W	PADS_A	Reference voltage adjust for PAD input stage. This register must be set to a higher value before a higher VDDIO is applied and set to a lower value after a lower VDDIO is applied. Reversing this order may damage the PADS. '0x' : For VDDIO: 1.75 ... 2.0 V '1x' : For VDDIO: 2.01 .. 3.45 V	0x11

**Table 316: GPIO\_DATA\_REG (0x00001220)**

Bit	Mode	Symbol	Description	Reset
15:10	-	-	Reserved	0x0
9:8	-	GPO_DATA	Write, set pin GPOx if output enabled with GPIO_MODE_REG[3-2]) Read, returns 0	0x0
7:0	R/W	GPIO_DATA	Write, set pin GPIOx (if output enabled with GPIO_DIR_REG[x]) Read, returns the value of pin value GPIOx Bit fields [7-4] and [1-0] are reserved.	0x0

**Table 317: GPIO\_SET\_DATA\_REG (0x00001222)**

Bit	Mode	Symbol	Description	Reset
15:10	-	-	Reserved	0x0
9:0	R/W	GPIO_SET	Writing a '1' sets GPIO_DATA_REG[x] to '1' if output enabled with GPIO_DIR_REG[x] Writing 0 is discarded, Reading returns 0 Bit fields [7-4] and [1-0] are reserved.	0x0

**Table 318: GPIO\_RESET\_DATA\_REG (0x00001224)**

Bit	Mode	Symbol	Description	Reset
15:10	-	-	Reserved	0x0
9:0	R/W	GPIO_RESET	Writing a '1' sets GPIO_DATA_REG[x] to '0' if output enabled with GPIO_DIR_REG[x] Writing 0 is discarded, Reading returns 0 Bit fields [7-4] and [1-0] are reserved.	0x0

**Table 319: GPIO\_DIR\_REG (0x00001226)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7:0	R/W	GPIO_DIR	'0': Pin GPIOx is input '1': Pin GPIOx is output Bit fields [7-4] and [1-0] are reserved. Keep reset value	0x0

**Table 320: GPIO\_PUPD\_REG (0x0000122A)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7:0	R/W	GPIO_PUPD	'0': Pull-up resistor disabled on pin GPIOx if input '1': Pull-up resistor enabled on pin GPIOx if input Bit fields [7-4] and [1-0] are reserved. Keep 1	0xFF

**Table 321: DMA0\_A\_STARTL\_REG (0x00001250)**

Bit	Mode	Symbol	Description	Reset
15:13	-	-	Reserved	0x0
12:0	R/W	DMA0_A_STARTL	Start source/destination address A The source/destination direction is set by bit DIR in DMA_CTRL_REGx.	0x0

**Table 322: DMA0\_A\_IDX\_REG (0x00001254)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7:0	R/W	DMA0_A_IDX	This register, added to DMA_A_START_REGx, is the source/destination address of the next DMA cycle. Incremented with 0 or 2 after each DMA cycle. The source/destination direction is set by bit DIR in CTRL_REGx	0x0

**Table 323: DMA0\_B\_STARTL\_REG (0x00001256)**

Bit	Mode	Symbol	Description	Reset
15:13	-	-	Reserved	0x0
12:0	R/W	DMA0_B_STARTL	Start source/destination address B The source/destination direction is set by bit DIR in CTRL_REGx.	0x0

**Table 324: DMA0\_B\_IDX\_REG (0x0000125A)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7:0	R/W	DMA0_B_IDX	This register, added to DMA_B_START_REGx, is the source/destination address of the next DMA cycle. Incremented with 0 or 2 after each DMA cycle. The source/destination direction is set by bit DIR in CTRL_REGx	0x0

**Table 325: DMA0\_LEN\_REG (0x0000125E)**

Bit	Mode	Symbol	Description	Reset
15:8	-	-	Reserved	0x0
7:0	R/W	DMA0_LEN	Length in bytes (DMA_LEN must be <= 0xFF - AINC) If this register equals DMA0_A_IDX_REG then if DMA_CIRCULAR = 0, then the DMA stops. DMA0_A_IDX_REG, DMA0_B_IDX_REG must be reset by SW if DMA_CIRCULAR = 1, then DMA_A_IDX_REG and DMA0_B_IDX_REG are both reset and DMA continues.	0x0

**Table 326: DMA0\_CTRL\_REG (0x00001260)**

Bit	Mode	Symbol	Description	Reset
15	-	-	Reserved	0x0
14	R/W	SYNC_SEL	'0': 8/16kHz trigger for DMA by CODEC (Note CODEC must be switched on) '1': Reserved	0x0
13:12	-	-	Reserved	0x0

**Table 326: DMA0\_CTRL\_REG (0x00001260)**

Bit	Mode	Symbol	Description	Reset
11	R/W	DREQ_LEVEL	'0': normal operation '1': Stop DMA if DMA_ON is set to '0'.	0x0
10	R/W	CIRCULAR	'0': Normal mode. The DMA channel stops if register DMA_A_IDX_REGx equals register DMA0_LEN_REG. This mode is for SPI operation. '1': Circular mode. If DMA0_A_IDX_REG equals register DMA0_LEN_REG, the DMA0_A_IDX_REG and DMA0_B_IDX_REG are both reset and the DMA starts from the start. This mode is used to transfer codec samples	0x0
9:8	R/W	AINC	Increment count DMA0_A_IDX_REG register. 00 : do not increment 01 : Reserved 10 : Increment address with one word	0x0
7:6	R/W	BINC	Increment count DMA0_B_IDX_REG register. 00 : do not increment 01 : Reserved 10 : Increment address with one word	0x0
5	R/W	DREQ_MODE	'0': DMA channel starts immediately. '1': DMA channel triggered by 8/16 kHz Codec clock	0x0
4	-	-	Reserved	0x0
3	R/W	IND	Reserved, must be set to 1	0x0
2	R/W	DIR	Transfer direction: '0' : A to B. '1' : B to A.	0x0
1	-	-	Reserved	0x0
0	R/W	DMA_ON	'0' : DMA channel is off, clocks are disabled '1' : DMA channel is on will be automatically cleared in normal mode after a complete transfer if DMA0_IDX_REG equals DMA0_LEN_REG. If DMA operation must be stopped before a transfer is completed, bit 11 must be set to '1' and DMA_ON must be set to '0'	0x0

**Table 327: CODEC\_MIC\_REG (0x00001280)**

Bit	Mode	Symbol	Description	Reset
15:13	-	-	Reserved	0x0
12	-	MICH_ON	Reserved, must be kept 0	0x0

**Table 338: CODEC\_DIV\_REG (0x000012E8)**

Bit	Mode	Symbol	Description	Reset
5:0	R/W	CODEC_DIV	Codec clock divider factor. This value determines the CODEC_CLK base frequency of 1.152 MHz (8kHz) resp 2.304 MHz (16 kHz) . The input frequency of this divider depends on the value of CLOCK_SOURCE and the PLL/ XTAL and PER_CLK. See Table 3 on page 8 for typical values.	0x20

**Table 339: VERSION\_REG0 (0x000012FA)**

Bit	Mode	Symbol	Description	Reset
7:0	R	VDEV1	First character of device type in ASCII. "439"	0x34

**Table 340: VERSION\_REG1 (0x000012FB)**

Bit	Mode	Symbol	Description	Reset
7:0	R	VDEV2	Second character of device type in ASCII. "439"	0x33

**Table 341: VERSION\_REG2 (0x000012FC)**

Bit	Mode	Symbol	Description	Reset
7:0	R	VDEV3	Third character of device type in ASCII. "439"	0x39

**Table 342: VERSION\_REG3 (0x000012FD)**

Bit	Mode	Symbol	Description	Reset
7:0	R	VCONF	Reserved	0x0

**Table 343: VERSION\_REG4 (0x000012FE)**

Bit	Mode	Symbol	Description	Reset
7:4	R	VREV	Chip version, corresponds with type number 0x1: 'A', 0x2: 'B', etc.	0x1
3:0	R	VMETAL	Metal change revision 0x0: No metal change in mask set of &quot;chip ver- sion&quot;; 0x1: first metal change. 0x2: Second metal change, etc.	0x0

**Table 344: VERSION\_REG5 (0x000012FF)**

Bit	Mode	Symbol	Description	Reset
7:0	R	VMODE	Reserved	0x0

## 7. Package information

### 7.1 MOISTURE SENSITIVITY LEVEL (MSL)

The MSL is an indicator for the maximum allowable time period (floor life time) in which a moisture sensitive plastic device, once removed from the dry bag, can be exposed to an environment with a maximum temperature of 30 °C and a maximum relative humidity of 60 % RH. before the solder reflow process.

QFN packages are qualified for MSL 3.

MSL Level	Floor Life Time
MSL 3	168 hours
MSL 1	Unlimited at 30°C/85%RH

### 7.2 SOLDERING INFORMATION

Refer to the JEDEC standard J-STD-020 for relevant soldering information.

This document can be downloaded from <http://www.jedec.org>

7.3 PACKAGE OUTLINES

## Status definitions

Version	Datasheet status	Product status	Definition
1.<n>	Target	Development	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
2.<n>	Preliminary	Qualification	This datasheet contains the specifications and preliminary characterisation data for products in pre-production. Specifications may be changed at any time without notice in order to improve the design.
3.<n>	Final	Production	This datasheet contains the final specifications for products in volume production. The specifications may be changed at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via Customer Product Notifications.
4.<n>	Obsolete	Archived	This datasheet contains the specifications for discontinued products. The information is provided for reference only.

## Disclaimer

Information in this document is believed to be accurate and reliable. However, Dialog Semiconductor does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information. Dialog Semiconductor furthermore takes no responsibility whatsoever for the content in this document if provided by any information source outside of Dialog Semiconductor.

Dialog Semiconductor reserves the right to change without notice the information published in this document, including without limitation the specification and the design of the related semiconductor products, software and applications.

Applications, software, and semiconductor products described in this document are for illustrative purposes only. Dialog Semiconductor makes no representation or warranty that such applications, software and semiconductor products will be suitable for the specified use without further testing or modification. Unless otherwise agreed in writing, such testing or modification is the sole responsibility of the customer and Dialog Semiconductor excludes all liability in this respect.

Customer notes that nothing in this document may be construed as a license for customer to use the Dialog Semiconductor products, software and applications referred to in this document. Such license must be separately sought by customer with Dialog Semiconductor.

All use of Dialog Semiconductor products, software and applications referred to in this document are subject to Dialog Semiconductor's Standard Terms and Conditions of Sale, unless otherwise stated.

## RoHS compliance

Dialog Semiconductor complies to European Directive 2001/95/EC and from 2 January 2013 onwards to European Directive 2011/65/EU concerning Restriction of Hazardous Substances (RoHS/RoHS2). Dialog Semiconductor's statement on RoHS can be found on the customer portal <https://support.diasemi.com/>. RoHS certificates from our suppliers are available on request.
