

USB 2.0 to 10/100 Ethernet Controller for Automotive Applications

PRODUCT FEATURES

Datasheet

Highlights

- Single Chip Hi-Speed USB 2.0 to 10/100 Ethernet Controller
- Integrated 10/100 Ethernet MAC with Full-Duplex Support
- Integrated 10/100 Ethernet PHY with HP Auto-MDIX Support
- Integrated USB 2.0 Hi-Speed Device Controller
- Integrated USB 2.0 Hi-Speed PHY
- Implements Reduced Power Operating Modes

Target Applications

- Diagnostic Interface (for Dealership Service Bay)
- Fast Software Download Interface (e.g., OBD Connector)
- Gateway Service Interface (Dealership, Aftermarket Repair Shop)
- In-vehicle Engineering Development Interface
- Vehicle Manufacturing Test Interface (Production Plant Assembly Line)
- Legislated Inspections (Emissions Check, Safety Inspections)

Key Features

- USB Device Controller
 - Fully compliant with Hi-Speed Universal Serial Bus Specification, revision 2.0
 - Supports HS (480 Mbps) and FS (12 Mbps) modes
 - Four Endpoints supported
 - Supports vendor specific commands
 - Integrated USB 2.0 PHY
 - Remote wakeup supported
- High-Performance 10/100 Ethernet Controller
 - Fully compliant with IEEE 802.3/802.3u
 - Integrated Ethernet MAC and PHY
 - 10BASE-T and 100BASE-TX support
 - Full- and half-duplex support
 - Full- and half-duplex flow control
 - Preamble generation and removal
 - Automatic 32-bit CRC generation and checking
 - Automatic payload padding and pad removal

- Loop-back modes
- TCP/UDP/IP/ICMP checksum offload support
- Flexible address filtering modes
 - One 48-bit perfect address
 - 64 hash-filtered multicast addresses
 - Pass all multicast
 - Promiscuous mode
 - Inverse filtering
 - Pass all incoming with status report
- Wakeup packet support
- Integrated Ethernet PHY
 - Auto-negotiation
 - Automatic polarity detection and correction
 - HP Auto-MDIX support
 - Link status change wake-up detection
- Support for three status LEDs
- External MII supports HomePNA[®] and HomePlug[®] PHY
- Power and I/Os
 - Various low power modes
 - NetDetach feature increases battery life
 - Supports PCI-like PME wake when USB Host disabled
 - 11 GPIOs
 - Supports bus-powered and self-powered operation
 - Integrated power-on reset circuit
 - Single external 3.3 V I/O supply
 - Optional internal core regulator
- Miscellaneous Features
 - EEPROM controller
 - Supports custom operation without EEPROM
 - IEEE 1149.1 (JTAG) boundary scan
 - Requires single 25 MHz crystal
- Software
 - Windows[®] 8/7/XP/Vista driver
 - Linux[®] driver
 - Win CE driver
 - MAC[®] OS driver
 - EEPROM utility
- Packaging
 - 56-pin QFN (8 x 8 mm), RoHS-compliant
- Environmental
 - -40°C to +85°C temperature range

Datasheet

Order Numbers:

LAN89530AM-A (Tray) for 56-pin, QFN, RoHS-compliant package (-40 to +85°C temp)

LAN89530AMR-A (Tape & Reel) for 56-pin, QFN, RoHS-compliant package (-40 to +85°C temp)

Chapter 1 Introduction

1.1 Block Diagram

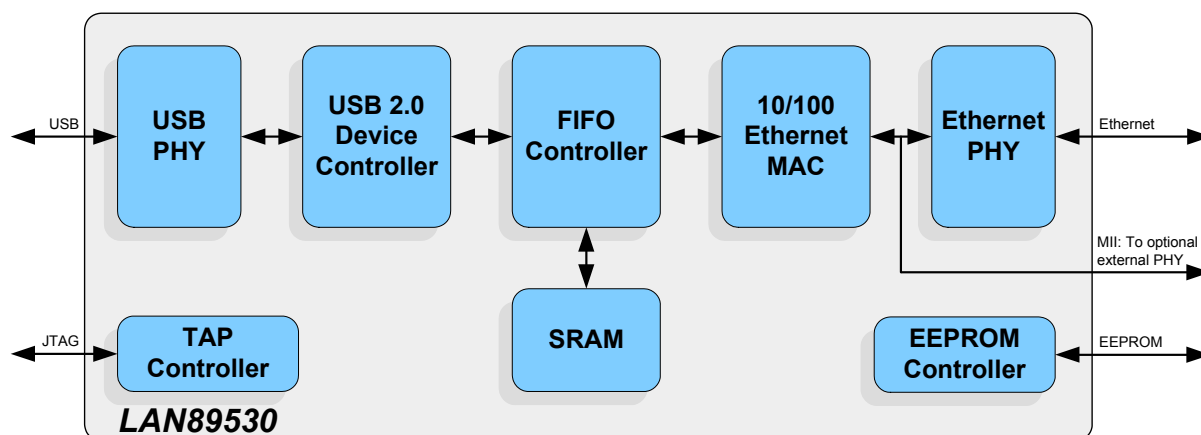

Figure 1.1 LAN89530 Block Diagram

1.2 Overview

The LAN89530 is a high performance solution for USB to 10/100 Ethernet port bridging. With automotive applications ranging from diagnostics, fast software download, gateway services, in-vehicle engineering development, manufacturing test and legislated inspection interfaces, the device is targeted as a high-performance, low-cost USB/Ethernet connectivity solution.

The LAN89530 contains an integrated 10/100 Ethernet PHY, USB PHY, Hi-Speed USB 2.0 device controller, 10/100 Ethernet MAC, TAP controller, EEPROM controller, and a FIFO controller with a total of 30 kB of internal packet buffering.

The internal USB 2.0 device controller and USB PHY are compliant with the USB 2.0 Hi-Speed standard. The device implements Control, Interrupt, Bulk-in and Bulk-out USB Endpoints.

The Ethernet controller supports auto-negotiation, auto-polarity correction, HP Auto-MDIX, and is compliant with the IEEE 802.3 and 802.3u standards. An external MII interface provides support for an external Fast Ethernet PHY, HomePNA, and HomePlug functionality.

Multiple power management features are provided, including various low-power modes, and Magic Packet, Wake On LAN and Link Status Change wake events. These wake events can be programmed to initiate a USB remote wakeup. The optional NetDetach feature provides additional power savings by detaching from the USB bus after the Ethernet cable is disconnected. A PCI-like PME wake is also supported when the Host controller is disabled.

An internal EEPROM controller exists to load various USB configuration information and the device MAC address. The integrated IEEE 1149.1 compliant TAP controller provides boundary scan via JTAG.

Datasheet

1.2.1 USB

The USB portion of the LAN89530 integrates a Hi-Speed USB 2.0 device controller and USB PHY.

The USB device controller (UDC) contains a USB low-level protocol interpreter which implements the USB bus protocol, packet generation/extraction, PID/Device ID parsing and CRC coding/decoding, with autonomous error handling. The USB device controller is capable of operating in USB 2.0 Hi-Speed and Full-Speed compliant modes and contains autonomous protocol handling functions such as handling of suspend/resume/reset conditions, remote wakeup, and stall condition clearing on Setup packets. The USB device controller also autonomously handles error conditions such as retry for CRC and data toggle errors, and generates NYET, STALL, ACK and NACK handshake responses, depending on the Endpoint buffer status.

The LAN89530 implements four USB Endpoints: Control, Interrupt, Bulk-in, and Bulk-out. The Bulk-in and Bulk-out Endpoints allow for Ethernet reception and transmission respectively. Implementation of vendor-specific commands allows for efficient statistics gathering and access to the device's system control and status registers.

The integrated USB 2.0-compliant device PHY supports Hi-Speed and Full-Speed modes.

1.2.2 FIFO Controller

The FIFO controller uses an internal SRAM to buffer RX and TX traffic. Bulk-out packets from the USB controller are directly stored into the TX buffer. Ethernet frames are directly stored into the RX buffer and become the basis for bulk-in packets.

1.2.3 Ethernet

LAN89530 integrates an IEEE 802.3 PHY for twisted pair Ethernet applications and a 10/100 Ethernet Media Access Controller (MAC).

The PHY can be configured for either 100 Mbps (100BASE-TX) or 10 Mbps (10BASE-T) Ethernet operation in either Full or Half Duplex configurations. The PHY block includes auto-negotiation, auto-polarity correction, and Auto-MDIX. Minimal external components are required for the utilization of the Integrated PHY.

Optionally, an external PHY may be used via the MII (Media Independent Interface) port, effectively bypassing the internal PHY. This option allows support for HomePNA and HomePlug applications.

The Ethernet MAC/PHY supports numerous power management wakeup features, including Magic Packet, Wake on LAN and Link Status Change. Eight wakeup frame filters are provided by the device.

1.2.4 Power Management

The LAN89530 features four variations of USB suspend: SUSPEND0, SUSPEND1, SUSPEND2 and SUSPEND3. These modes allow the application to select the ideal balance of remote wakeup functionality and power consumption.

- **SUSPEND0:** Supports GPIO, Wake On LAN and Magic Packet events. This state reduces power by stopping the clocks of the MAC and other internal modules.
- **SUSPEND1:** Supports GPIO and Link Status Change for remote wakeup events. This suspend state consumes less power than SUSPEND0.
- **SUSPEND2:** Supports only GPIO assertion for a remote wakeup event. This is the default suspend mode for the device.
- **SUSPEND3:** Supports GPIO and Good Packet events. A Good Packet is a received frame passing certain filtering constraints independent of those imposed on Wake On LAN and Magic Packet frames. This suspend state consumes power at a level similar to the full operational state, however, it allows for power savings in the Host CPU.

1.2.5 EEPROM Controller (EPC)

LAN89530 contains an EEPROM controller for connection to an external EEPROM. This allows for the automatic loading of static configuration data upon power-on reset, pin reset or software reset. The EEPROM can be configured to load USB descriptors, USB device configuration and MAC address.

1.2.6 General Purpose I/O

When configured for Internal PHY Mode, up to eleven GPIOs are supported. All GPIOs can serve as remote wakeup events when the LAN89530 is suspended.

1.2.7 System Software

LAN89530 software drivers are available for the following operating systems:

- Windows 8
- Windows 7
- Windows Vista
- Windows XP
- Linux
- Win CE
- MAC OS

In addition, an EEPROM programming utility is available for configuring the external EEPROM.

Chapter 2 Pin Description and Configuration

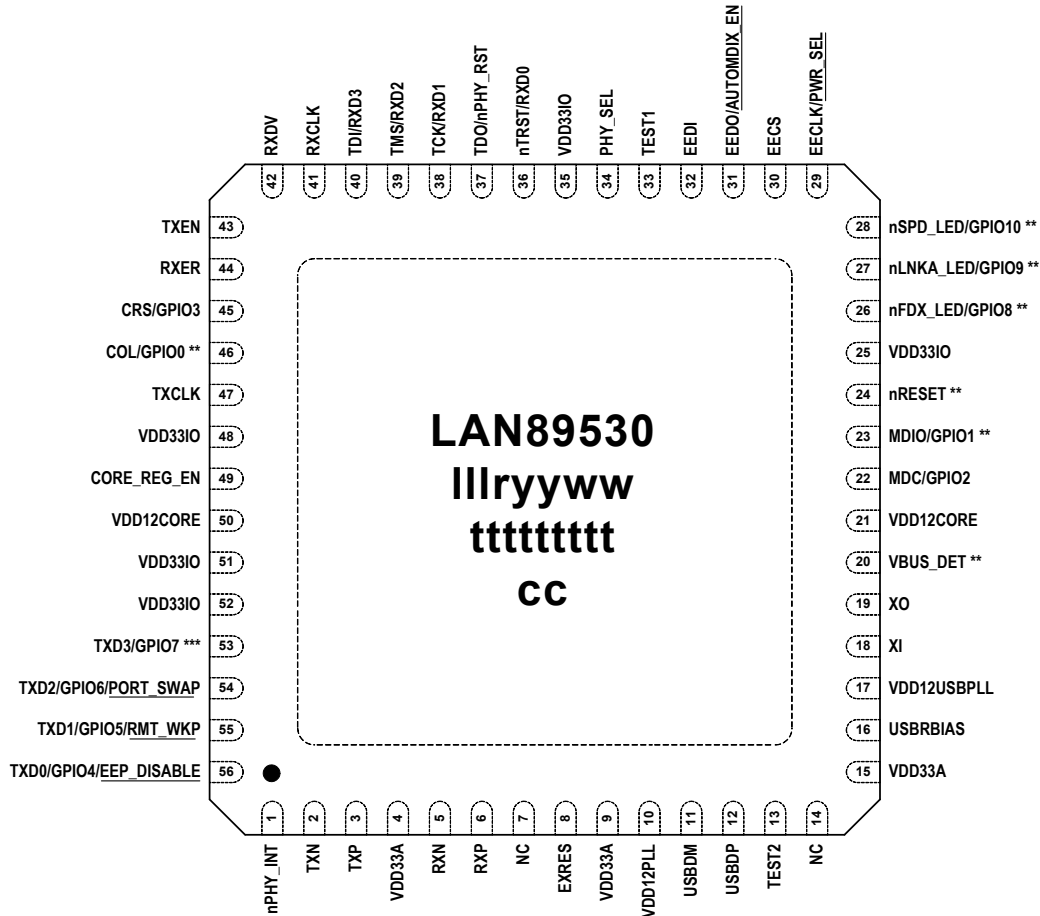

Figure 2.1 Pin Assignments (TOP VIEW)

The package designators are:

- Ill - Lot Sequence Code (optional)
- r - Chip Revision Number
- yy - last two digits of Assembly Year
- ww - Assembly Work Week
- tttttttttt - Tracking Number (up to 9 characters)
- cc - Country of Original Abbreviation (Optional - up to 2 characters)

Note: ** This pin provides additional PME related functionality. Refer to the respective pin descriptions and [Chapter 5, "PME Operation," on page 36](#) for additional information.

Note: *** GPIO7 may provide additional PHY Link Up related functionality.

Note: When HP Auto-MDIX is activated, the TXN/TXP pins can function as RXN/RXP and vice-versa.

Note: Exposed pad (VSS) on bottom of package must be connected to ground.

Table 2.1 MII Interface Pins

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	Receive Error (Internal PHY Mode)	RXER	IS/O8 (PD)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Receive Error (External PHY Mode)	RXER	IS (PD)	In External PHY Mode, the signal on this pin is input from the external PHY and indicates a receive error in the packet.
1	Transmit Enable (Internal PHY Mode)	TXEN	IS/O8 (PD)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Transmit Enable (External PHY Mode)	TXEN	O8 (PD)	In External PHY Mode, this pin functions as an output to the external PHY and indicates valid data on TXD[3:0].
1	Receive Data Valid (Internal PHY Mode)	RXDV	IS/O8 (PD)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Receive Data Valid (External PHY Mode)	RXDV	IS (PD)	In External PHY Mode, the signal on this pin is input from the external PHY and indicates valid data on RXD[3:0].
1	Receive Clock (Internal PHY Mode)	RXCLK	IS/O8 (PD)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Receive Clock (External PHY Mode)	RXCLK	IS (PD)	In External PHY Mode, this pin is the receiver clock input from the external PHY.
1	Transmit Clock (Internal PHY Mode)	TXCLK	IS/O8 (PU)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Transmit Clock (External PHY Mode)	TXCLK	IS (PU)	In External PHY Mode, this pin is the transmitter clock input from the external PHY.

Datasheet

Table 2.1 MII Interface Pins (continued)

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	Carrier Sense (Internal PHY Mode)	CRS	IS/O8 (PU)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Carrier Sense (External PHY Mode)	CRS	IS (PD)	In External PHY Mode, the signal on this pin is input from the external PHY and indicates a network carrier.
	General Purpose I/O 3 (Internal PHY Mode Only)	GPIO3	IS/O8/ OD8 (PU)	This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output or a Schmitt-triggered input.
1	MII Collision Detect (Internal PHY Mode)	COL	IS/O8 (PU)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	MII Collision Detect (External PHY Mode)	COL	IS (PD)	In External PHY Mode, the signal on this pin is input from the external PHY and indicates a collision event.
	General Purpose I/O 0 (Internal PHY Mode Only)	GPIO0	IS/O8/ OD8 (PU)	This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output or a Schmitt-triggered input. Note: This pin may be used to signal PME when Internal PHY and PME Modes of operation are in effect. Refer to Chapter 5, "PME Operation," on page 36 for additional information.
1	Management Data (Internal PHY Mode)	MDIO	IS/O8 (PU)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Management Data (External PHY Mode)	MDIO	IS/O8 (PD)	In External PHY Mode, this pin provides the management data to/from the external PHY.
	General Purpose I/O 1 (Internal PHY Mode Only)	GPIO1	IS/O8/ OD8 (PU)	This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output or a Schmitt-triggered input. Note: This pin may serve as the PME_MODE_SEL input when Internal PHY and PME Modes of operation are in effect. Refer to Chapter 5, "PME Operation," on page 36 for additional information.

Table 2.1 MII Interface Pins (continued)

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	Management Clock (Internal PHY Mode)	MDC	IS/O8 (PU)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Management Clock (External PHY Mode)	MDC	O8 (PD)	In External PHY Mode, this pin outputs the management clock to the external PHY.
	General Purpose I/O 2 (Internal PHY Mode Only)	GPIO2	IS/O8/ OD8 (PU)	This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output or a Schmitt-triggered input.
1	Transmit Data 3 (Internal PHY Mode)	TXD3	IS/O8 (PU)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Transmit Data 3 (External PHY Mode)	TXD3	O8 (PU)	In External PHY Mode, this pin functions as the transmit data 3 output to the external PHY.
	General Purpose I/O 7 (Internal PHY Mode Only)	GPIO7	IS/O8/ OD8 (PU)	This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output or a Schmitt-triggered input. Note: GPIO7 may provide additional external PHY Link Up related functionality.
1	Transmit Data 2 (Internal PHY Mode)	TXD2	IS/O8 (PD)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Transmit Data 2 (External PHY Mode)	TXD2	O8 (PD)	In External PHY Mode, this pin functions as the transmit data 2 output to the external PHY.
	General Purpose I/O 6 (Internal PHY Mode Only)	GPIO6	IS/O8/ OD8 (PU)	This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output, or a Schmitt-triggered input.
	USB Port Swap Configuration Strap	<u>PORT_SWAP</u>	IS (PD)	Swaps the mapping of USBDP and USBDM. 0 = USBDP maps to the USB D+ line and USBDM maps to the USB D- line. 1 = USBDP maps to the USB D- line. USBDM maps to the USB D+ line. See Note 2.1 for more information on configuration straps.

Datasheet

Table 2.1 MII Interface Pins (continued)

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	Transmit Data 1 (Internal PHY Mode)	TXD1	IS/O8 (PD)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Transmit Data 1 (External PHY Mode)	TXD1	O8 (PD)	In External PHY Mode, this pin functions as the transmit data 1 output to the external PHY.
	General Purpose I/O 5 (Internal PHY Mode Only)	GPIO5	IS/O8/ OD8 (PU)	This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output or a Schmitt-triggered input.
	Remote Wakeup Configuration Strap	<u>RMT_WKP</u>	IS (PD)	This strap configures the default descriptor values to support remote wakeup. This strap is overridden by the EEPROM. 0 = Remote wakeup is not supported. 1 = Remote wakeup is supported. See Note 2.1 for more information on configuration straps.
1	Transmit Data 0 (Internal PHY Mode)	TXD0	IS/O8 (PD)	In Internal PHY Mode, this pin can be configured to display the respective internal MII signal.
	Transmit Data 0 (External PHY Mode)	TXD0	O8 (PD)	In External PHY Mode, this pin functions as the transmit data 0 output to the external PHY.
	General Purpose I/O 4 (Internal PHY Mode Only)	GPIO4	IS/O8/ OD8 (PU)	This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output or a Schmitt-triggered input.
	EEPROM Disable Configuration Strap	<u>EEP_DISABLE</u>	IS (PD)	This strap disables the autoloading of the EEPROM contents. The assertion of this strap does not prevent register access to the EEPROM. 0 = EEPROM is recognized if present. 1 = EEPROM is not recognized even if it is present. See Note 2.1 for more information on configuration straps.

Table 2.2 EEPROM Pins

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	EEPROM Data In	EEDI	IS (PD)	This pin is driven by the EEDO output of the external EEPROM.
1	EEPROM Data Out	EEDO	O8 (PU)	This pin drives the EEDI input of the external EEPROM.
	Auto-MDIX Enable Configuration Strap	<u>AUTOMDIX_EN</u>	IS (PU)	Determines the default Auto-MDIX setting. 0 = Auto-MDIX is disabled. 1 = Auto-MDIX is enabled. See Note 2.1 for more information on configuration straps.
1	EEPROM Chip Select	EECS	O8	This pin drives the chip select output of the external EEPROM. Note: The EECS output may tri-state briefly during power-up. Some EEPROM devices may be prone to false selection during this time. When an EEPROM is used, an external pull-down resistor is recommended on this signal to prevent false selection. Refer to your EEPROM manufacturer's datasheet for additional information.
1	EEPROM Clock	EECLK	O8 (PD)	This pin drives the EEPROM clock of the external EEPROM.
	Power Select Configuration Strap	<u>PWR_SEL</u>	IS (PD)	Determines the default power setting when no EEPROM is present. This strap is overridden by the EEPROM. 0 = The device is bus powered. 1 = The device is self powered. See Note 2.1 for more information on configuration straps.

Note 2.1 Configuration strap values are latched on Power-On Reset (POR) or External Chip Reset (nRESET). Configuration straps are identified by an underlined symbol name. Pins that function as configuration straps must be augmented with an external resistor when connected to a load.

Datasheet

Table 2.3 JTAG Pins

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	JTAG Test Port Reset (Internal PHY Mode)	nTRST	IS (PU)	In Internal PHY Mode, this active-low pin functions as the JTAG test port reset input.
	Receive Data 0 (External PHY Mode)	RXD0	IS (PD)	In External PHY Mode, this pin functions as the receive data 0 input from the external PHY.
1	JTAG Test Data Out (Internal PHY Mode)	TDO	O8	In Internal PHY Mode, this pin functions as the JTAG data output.
	PHY Reset (External PHY Mode)	nPHY_RST	O8	In External PHY Mode, this active-low pin functions as the PHY reset output.
1	JTAG Test Clock (Internal PHY Mode)	TCK	IS (PU)	In Internal PHY Mode, this pin functions as the JTAG test clock. The maximum operating frequency of this clock is 25 MHz.
	Receive Data 1 (External PHY Mode)	RXD1	IS (PD)	In External PHY Mode, this pin functions as the receive data 1 input from the external PHY.
1	JTAG Test Mode Select (Internal PHY Mode)	TMS	IS (PU)	In Internal PHY Mode, this pin functions as the JTAG test mode select.
	Receive Data 2 (External PHY Mode)	RXD2	IS (PD)	In External PHY Mode, this pin functions as the receive data 2 input from the external PHY.
1	JTAG Test Data Input (Internal PHY Mode)	TDI	IS (PU)	In Internal PHY Mode, this pin functions as the JTAG data input.
	Receive Data 3 (External PHY Mode)	RXD3	IS (PD)	In External PHY Mode, this pin functions as the receive data 3 input from the external PHY.

Table 2.4 Miscellaneous Pins

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	PHY Select	PHY_SEL	IS (PD)	<p>Selects whether to use the internal Ethernet PHY or the external PHY connected to the MII port.</p> <p>0 = Internal PHY is used. 1 = External PHY is used.</p> <p>Note: When in External PHY Mode, the internal PHY is placed into general power down after a POR.</p>
1	System Reset	nRESET	IS (PU)	<p>This active-low pin allows external hardware to reset the device.</p> <p>Note: This pin may be used to signal PME_CLEAR when PME Mode of operation is in effect. Refer to Chapter 5, "PME Operation," on page 36 for additional information.</p>
1	Ethernet Full-Duplex Indicator LED	nFDX_LED	OD12 (PU)	<p>This pin is driven low (LED on) when the Ethernet link is operating in Full-Duplex mode.</p>
	General Purpose I/O 8	GPIO8	IS/O12/OD12 (PU)	<p>This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output or a Schmitt-triggered input.</p> <p>Note: This pin may be used to signal PME when External PHY and PME Modes of operation are in effect. Refer to Chapter 5, "PME Operation," on page 36 for additional information.</p> <p>Note: By default this pin is configured as a GPIO.</p>
1	Ethernet Link Activity Indicator LED	nLNKA_LED	OD12 (PU)	<p>This pin is driven low (LED on) when a valid link is detected. This pin is pulsed high (LED off) for 80 ms whenever transmit or receive activity is detected. This pin is then driven low again for a minimum of 80 ms, after which time it will repeat the process if TX or RX activity is detected. Effectively, LED2 is activated solid for a link. When transmit or receive activity is sensed, LED2 will function as an activity indicator.</p>
	General Purpose I/O 9	GPIO9	IS/O12/OD12 (PU)	<p>This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output or a Schmitt-triggered input.</p> <p>Note: This pin may serve as the PME_MODE_SEL input when External PHY and PME Modes of operation are in effect. Refer to Chapter 5, "PME Operation," on page 36 for additional information.</p> <p>Note: By default this pin is configured as a GPIO.</p>

Datasheet

Table 2.4 Miscellaneous Pins (continued)

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	Ethernet Speed Indicator LED	nSPD_LED	OD12 (PU)	This pin is driven low (LED on) when the Ethernet operating speed is 100 Mbs, or during auto-negotiation. This pin is driven high during 10 Mbs operation or during line isolation.
	General Purpose I/O 10	GPIO10	IS/O12/OD12 (PU)	This General Purpose I/O pin is fully programmable as either a push-pull output, an open-drain output or a Schmitt-triggered input. Note: This pin may serve as a wakeup pin whose detection mode is selectable when External PHY and PME Modes of operation are in effect. Refer to Chapter 5, "PME Operation," on page 36 for additional information. Note: By default this pin is configured as a GPIO.
1	Core Regulator Enable	CORE_REG_EN	AI	This pin enables/disables the internal core logic voltage regulator. When tied low to VSS, the internal core regulator is disabled and +1.2 V must be supplied to the device by an external source. When tied high to +3.3 V, the internal core regulator is enabled. Refer to Chapter 3, "Power Connections," on page 23 and the device reference schematics for connection information.
1	Test 1	TEST1	-	This pin must always be connected to VSS for proper operation.
1	Test 2	TEST2	-	This pin must always be connected to +3.3 V for proper operation.
1	Crystal Input	XI	ICLK	External 25 MHz crystal input. Note: This pin can also be driven by a single-ended clock oscillator. When this method is used, XO should be left unconnected
1	Crystal Output	XO	OCLK	External 25 MHz crystal output.

Table 2.5 USB Pins

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	USB DMINUS	USBDM	AIO	Note: The functionality of this pin may be swapped to USB DPLUS via the PORT_SWAP configuration strap.
1	USB DPLUS	USBDP	AIO	Note: The functionality of this pin may be swapped to USB DMINUS via the PORT_SWAP configuration strap.
1	Detect Upstream VBUS Power	VBUS_DET	IS_5V (PD)	<p>Detects state of upstream bus power.</p> <p>For bus powered applications, this pin must be tied to VDD33IO.</p> <p>For self powered applications where the device is permanently attached to a host, VBUS_DET should be pulled to VDD33IO. For other self powered applications, refer to the device reference schematic for additional connection information.</p> <p>Note: This pin may be used to signal bus power availability when PME Mode of operation is in effect. Refer to Chapter 5, "PME Operation," on page 36 for additional information.</p>
1	External USB Bias Resistor	USBRBIAS	AI	Used for setting HS transmit current level and on-chip termination impedance. Connect to an external 12.0 kΩ 1.0% resistor to ground.

Table 2.6 Ethernet PHY Pins

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	Ethernet TX Data Out Negative	TXN	AIO	The transmit data outputs may be swapped internally with receive data inputs when Auto-MDIX is enabled.
1	Ethernet TX Data Out Positive	TXP	AIO	The transmit data outputs may be swapped internally with receive data inputs when Auto-MDIX is enabled.
1	Ethernet RX Data In Negative	RXN	AIO	The receive data inputs may be swapped internally with transmit data outputs when Auto-MDIX is enabled.
1	Ethernet RX Data In Positive	RXP	AIO	The receive data inputs may be swapped internally with transmit data outputs when Auto-MDIX is enabled.

Datasheet

Table 2.6 Ethernet PHY Pins (continued)

NUM PINS	NAME	SYMBOL	BUFFER TYPE	DESCRIPTION
1	PHY Interrupt (Internal PHY Mode)	nPHY_INT	O8	In Internal PHY Mode, this pin can be configured to output the internal PHY interrupt signal. Note: The internal PHY interrupt signal is active-high.
	PHY Interrupt (External PHY Mode)	nPHY_INT	IS (PU)	In External PHY Mode, the active-low signal on this pin is input from the external PHY and indicates a PHY interrupt has occurred.
1	External PHY Bias Resistor	EXRES	AI	Used for the internal bias circuits. Connect to an external 12.0 kΩ 1.0% resistor to ground.

Table 2.7 Power Pins and Ground Pad

EXPOSED PAD MUST BE CONNECTED TO VSS							

Note 2.2 This pin provides additional PME-related functionality. Refer to the respective pin descriptions and [Section Chapter 5, "PME Operation," on page 36](#) for additional information.

2.2 Buffer Types

Table 2.10 Buffer Types

BUFFER TYPE	DESCRIPTION
IS	Schmitt-triggered input
IS_5V	5 V tolerant Schmitt-triggered input
O8	Output with 8 mA sink and 8 mA source
OD8	Open-drain output with 8 mA sink
O12	Output with 12 mA sink and 12 mA source
OD12	Open-drain output with 12 mA sink
PU	50 μ A (typical) internal pull-up. Unless otherwise noted in the pin description, internal pull-ups are always enabled. Note: Internal pull-up resistors prevent unconnected inputs from floating. Do not rely on internal resistors to drive signals external to the device. When connected to a load that must be pulled high, an external resistor must be added.
PD	50 μ A (typical) internal pull-down. Unless otherwise noted in the pin description, internal pull-downs are always enabled. Note: Internal pull-down resistors prevent unconnected inputs from floating. Do not rely on internal resistors to drive signals external to the device. When connected to a load that must be pulled low, an external resistor must be added.
AI	Analog input
AIO	Analog bi-directional
ICLK	Crystal oscillator input pin
OCLK	Crystal oscillator output pin
P	Power pin

Chapter 3 Power Connections

The LAN89530 can be operated with the internal core regulator enabled or disabled. [Figure 3.1](#) illustrates the power connections for operating the device with the internal regulator enabled. [Figure 3.2](#) illustrates the power connections for operating the device with the internal regulator disabled. In this mode, +1.2 V must be supplied to the device by an external source.

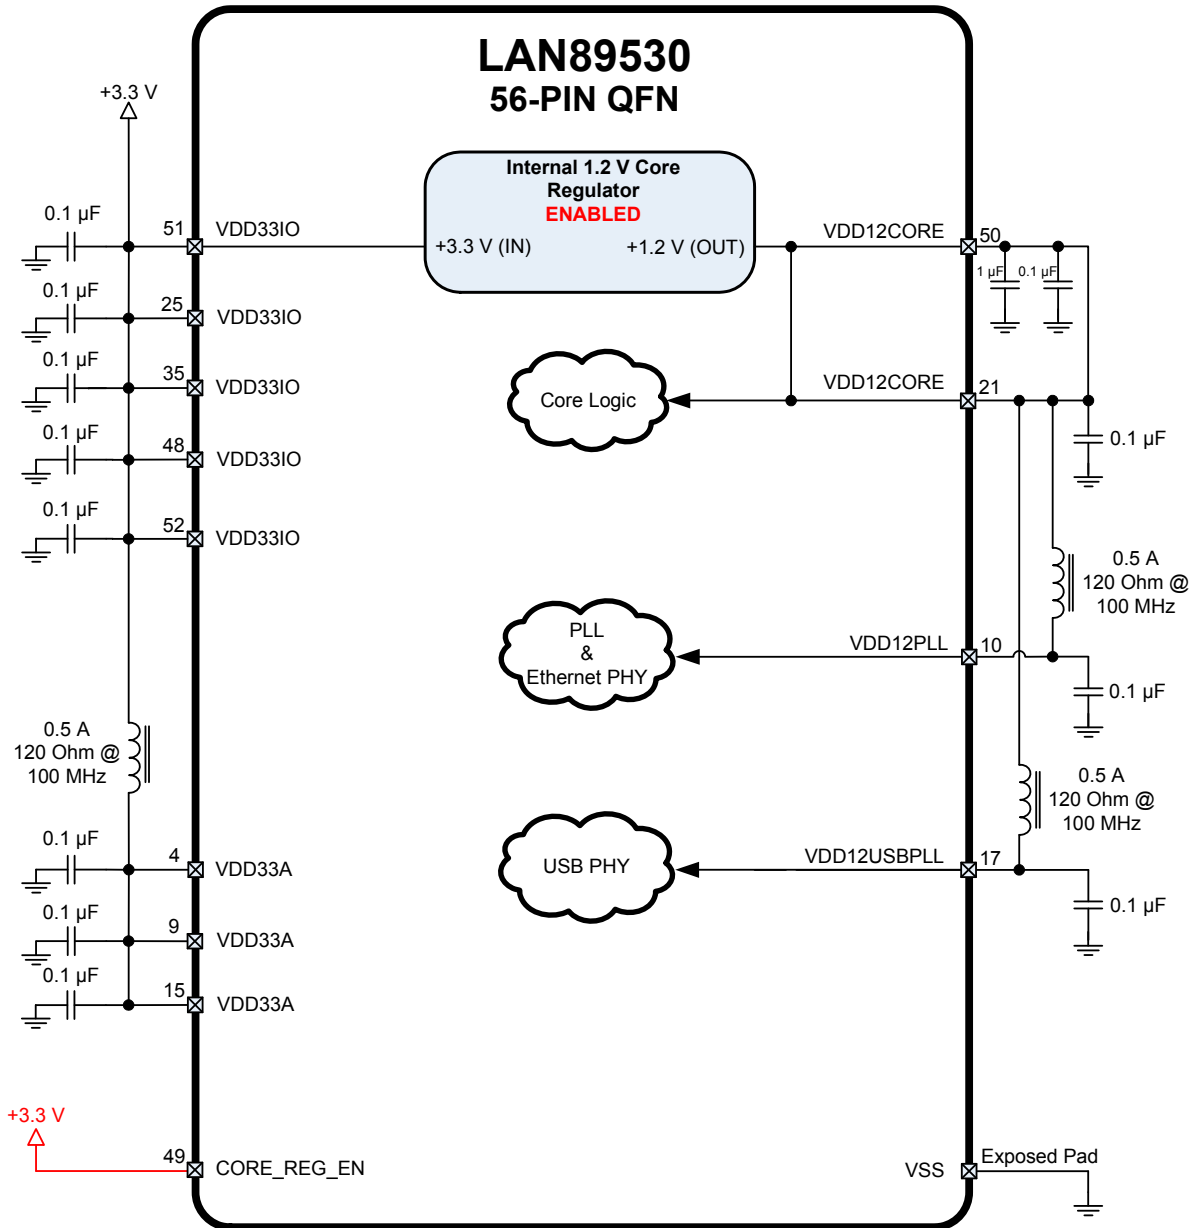

Figure 3.1 Power Connections - Internal Regulator Enabled

Datasheet

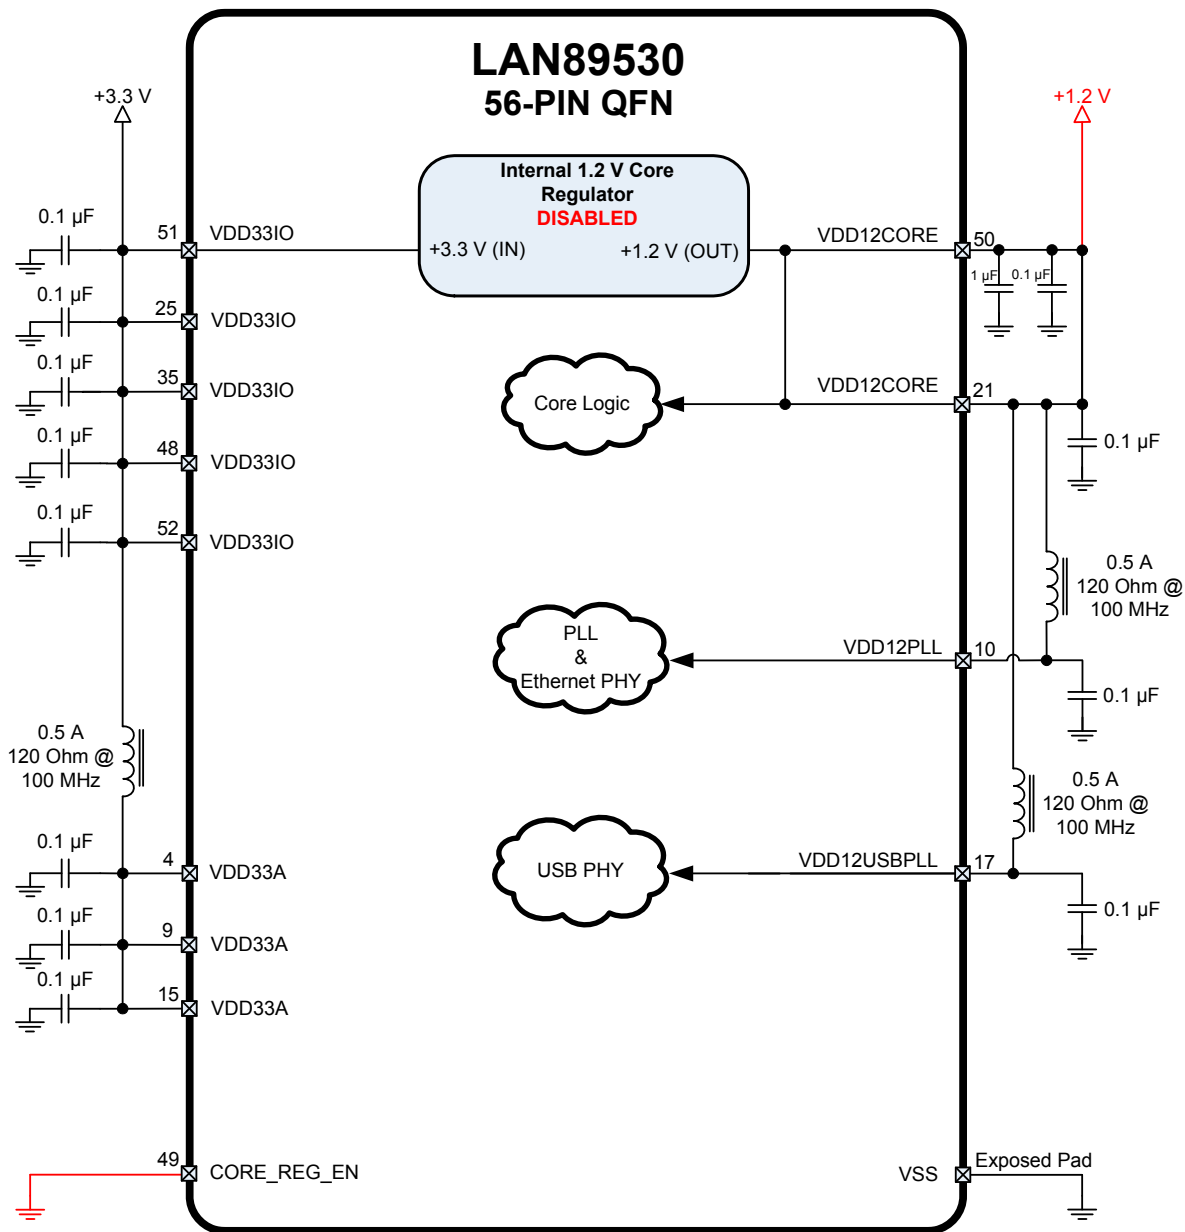

Figure 3.2 Power Connections - Internal Regulator Disabled

Chapter 4 EEPROM Controller

The device may use an external EEPROM to store the default values for the USB descriptors and the MAC address. The EEPROM controller supports most 256/512 byte “93C46” type EEPROMs.

Note: A 3-wire style 2k/4k EEPROM that is organized for 256/512 x 8-bit operation must be used.

The MAC address is used as the default Ethernet MAC address and is loaded into the MAC’s ADDRH and ADDRL registers. If a properly configured EEPROM is not detected, it is the responsibility of the Host LAN Driver to set the IEEE addresses.

After a system-level reset occurs, the device will load the default values from a properly configured EEPROM. The device will not accept USB transactions from the Host until this process is completed.

The EEPROM controller also allows the Host system to read, write and erase the contents of the serial EEPROM.

4.1 EEPROM Format

Table 4.1 illustrates the format in which data is stored inside of the EEPROM.

Note the EEPROM offsets are given in units of 16-bit word offsets. A length field with a value of zero indicates that the field does not exist in the EEPROM. The device will use the field’s HW default value in this case.

Note: For the device descriptor, the only valid values for the length are 0 and 18.

Note: For the configuration and interface descriptor, the only valid values for the length are 0 and 18.

Note: The EEPROM programmer must ensure that if a string descriptor does not exist in the EEPROM, the referencing descriptor must contain 00h for the respective string index field.

Note: If all string descriptor lengths are zero, then a Language ID will not be supported.

Table 4.1 EEPROM Format

EEPROM ADDRESS	EEPROM CONTENTS
00h	0xA5
01h	MAC Address [7:0]
02h	MAC Address [15:8]
03h	MAC Address [23:16]
04h	MAC Address [31:24]
05h	MAC Address [39:32]
06h	MAC Address [47:40]
07h	Full-Speed Polling Interval for Interrupt Endpoint
08h	Hi-Speed Polling Interval for Interrupt Endpoint
09h	Configuration Flags
0Ah	Language ID Descriptor [7:0]

Datasheet

Table 4.1 EEPROM Format (continued)

0Bh	Language ID Descriptor [15:8]
0Ch	Manufacturer ID String Descriptor Length (bytes)
0Dh	Manufacturer ID String Descriptor EEPROM Word Offset
0Eh	Product Name String Descriptor Length (bytes)
0Fh	Product Name String Descriptor EEPROM Word Offset
10h	Serial Number String Descriptor Length (bytes)
11h	Serial Number String Descriptor EEPROM Word Offset
12h	Configuration String Descriptor Length (bytes)
13h	Configuration String Descriptor Word Offset
14h	Interface String Descriptor Length (bytes)
15h	Interface String Descriptor Word Offset
16h	Hi-Speed Device Descriptor Length (bytes)
17h	Hi-Speed Device Descriptor Word Offset
18h	Hi-Speed Configuration and Interface Descriptor Length (bytes)
19h	Hi-Speed Configuration and Interface Descriptor Word Offset
1Ah	Full-Speed Device Descriptor Length (bytes)
1Bh	Full-Speed Device Descriptor Word Offset
1Ch	Full-Speed Configuration and Interface Descriptor Length (bytes)
1Dh	Full-Speed Configuration and Interface Descriptor Word Offset
1Eh	GPIO7:0 Wakeup Enables Bit x = 0 -> GPIOx pin disabled for wakeup use. Bit x = 1 -> GPIOx pin enabled for wakeup use.
1Fh	GPIO10:8 Wakeup Enables Bit x = 0 -> GPIO(x+8) pin disabled for wakeup use. Bit x = 1 -> GPIO(x+8) pin enabled for wakeup use.
20h	GPIO PME Flags

Note: The descriptor type for the device descriptors specified in the EEPROM is a don't care and always overwritten by HW to 0x1.
The descriptor size for the device descriptors specified in the EEPROM is a don't care and always overwritten by HW to 0x12.
The descriptor type for the configuration descriptors specified in the EEPROM is a don't care and always overwritten by HW to 0x2.

Note: Descriptors specified in EEPROM having bcdUSB, bMaxPacketSize0, and bNumConfigurations fields defined with values other than 0200h, 40h and 1, respectively, will result in unwanted behavior and untoward results.

Note: EEPROM byte addresses past 20h can be used to store data for any purpose.

Table 4.2 describes the configuration flags. The configuration flags override the affects of the RMT_WKP and PWR_SEL straps. If a configuration descriptor exists in the EEPROM it will override both the configuration flags and associated straps.

Table 4.2 Configuration Flags

Datasheet

Table 4.3 describes the GPIO PME flags.

Table 4.3 GPIO PME Flags

BITS	DESCRIPTION
7	<p>GPIO PME Enable Setting this bit enables the assertion of the GPIO0 or GPIO8 pin, as a result of a Wakeup (GPIO) pin, Magic Packet or PHY Link Up. The host processor may use the GPIO0/GPIO8 pin to asynchronously wake up, in a manner analogous to a PCI PME pin. GPIO0 signals the event when operating in Internal PHY Mode, while GPIO8 signals the event when operating in External PHY Mode. Internal or External PHY Mode of operation is dictated by the PHY_SEL pin.</p> <p>0 = The device does not support GPIO PME signaling. 1 = The device supports GPIO PME signaling.</p> <p>Note: When this bit is 0, the remaining GPIO PME parameters in this flag byte are ignored.</p>
6	<p>GPIO PME Configuration This bit selects whether the GPIO PME is signaled on the GPIO pin as a level or a pulse. If pulse is selected, the duration of the pulse is determined by the setting of the GPIO PME Length bit of this flag byte. The level of the signal or the polarity of the pulse is determined by the GPIO PME Polarity bit of this flag byte.</p> <p>0 = GPIO PME is signaled via a level. 1 = GPIO PME is signaled via a pulse.</p> <p>Note: If GPIO PME Enable is 0, this bit is ignored.</p>
5	<p>GPIO PME Length When the GPIO PME Configuration bit of this flag byte indicates that the GPIO PME is signaled by a pulse on the GPIO pin, this bit determines the duration of the pulse.</p> <p>0 = GPIO PME pulse length is 1.5 ms. 1 = GPIO PME pulse length is 150 ms.</p> <p>Note: If GPIO PME Enable is 0, this bit is ignored.</p>
4	<p>GPIO PME Polarity Specifies the level of the signal or the polarity of the pulse used for GPIO PME signaling.</p> <p>0 = GPIO PME signaling polarity is low. 1 = GPIO PME signaling polarity is high.</p> <p>Note: If GPIO PME Enable is 0, this bit is ignored.</p>
3	<p>GPIO PME Buffer Type This bit selects the output buffer type for GPIO0/GPIO8.</p> <p>0 = Open drain driver / open source 1 = Push-Pull driver</p> <p>Note: Buffer Type = 0, Polarity = 0 implies open drain Buffer Type = 0, Polarity = 1 implies open source</p> <p>Note: If GPIO PME Enable is 0, this bit is ignored.</p>
2	<p>GPIO PME WOL Select Three types of wakeup events are supported; Magic Packet, PHY Link Up and Wakeup Pin(s) assertion. Wakeup Pin(s) are selected via the GPIO Wakeup Enables specified in bytes 1Eh and 1Fh of the EEPROM. This bit selects whether Magic Packet or Link Up wakeup events are supported.</p> <p>0 = Magic Packet wakeup supported. 1 = PHY Link Up wakeup supported (not supported in External PHY Mode).</p> <p>Note: If GPIO PME Enable is 0, this bit is ignored.</p>

Table 4.3 GPIO PME Flags (continued)

BITS	DESCRIPTION
1	<p>GPIO10 Detection Select This bit selects the detection mode for GPIO10 when operating in PME Mode. In PME Mode, GPIO10 is usable in both Internal and External PHY Mode as a wakeup pin. This parameter defines whether the wakeup should occur on an active high or active low signal.</p> <p>0 = Active-low detection for GPIO10 1 = Active-high detection for GPIO10</p> <p>Note: If GPIO PME Enable is 0, this bit is ignored.</p>
0	RESERVED

4.2 EEPROM Defaults

The signature value of 0xA5 is stored at address 0. A different signature value indicates to the EEPROM controller that no EEPROM or an un-programmed EEPROM is attached to the device. In this case, the hardware default values are used, as shown in [Table 4.4](#).

Table 4.4 EEPROM Defaults

FIELD	DEFAULT VALUE
MAC Address	FFFFFFFFFFFFh
Full-Speed Polling Interval (ms)	01h
Hi-Speed Polling Interval (ms)	04h
Configuration Flags	04h
Maximum Power (mA)	FAh
Vendor ID	0424h
Product ID	9E08h

Note: The [Configuration Flags](#) are affected by the PWR_SEL and RMT_WKP straps.

4.3 EEPROM Auto-Load

Certain system level resets (USB reset, POR, nRESET and SRST) cause the EEPROM contents to be loaded into the device. After a reset, the EEPROM controller attempts to read the first byte of data from the EEPROM. If the value 0xA5 is read from the first address, then the EEPROM controller will assume that an external Serial EEPROM is present.

Note: The USB reset only loads the MAC address.

4.4 Example of EEPROM Format Interpretation

Table 4.5 and Table 4.6 provide an example of how the contents of a EEPROM are formatted. Table 4.5 is a dump of the EEPROM memory (256-byte EEPROM), while Table 4.6 illustrates, byte by byte, how the EEPROM is formatted.

Table 4.5 Dump of EEPROM Memory

4.5 Customized Operation Without EEPROM

The device provides the capability to customize operation without the use of an EEPROM. Descriptor information and initialization quantities normally fetched from EEPROM and used to initialize descriptors and elements of the System Control and Status registers may be specified via an alternate mechanism. This alternate mechanism involves the use of the Descriptor RAM in conjunction with the Attribute registers and select elements of the System Control and Status registers. The software device driver orchestrates the process by performing the following actions in the order indicated:

- Initialization of System Control and Status register elements in lieu of EEPROM load
- Attribute register initialization
- Descriptor RAM initialization
- Enable Descriptor RAM and Flag Attribute registers as source
- Inhibit reset of Select System Control and Status register elements

Chapter 5 PME Operation

The device provides a mechanism for waking up a host system via PME Mode of operation. PME signaling is only available while the device is operating in the self-powered mode. [Figure 5.1](#) illustrates a typical application.

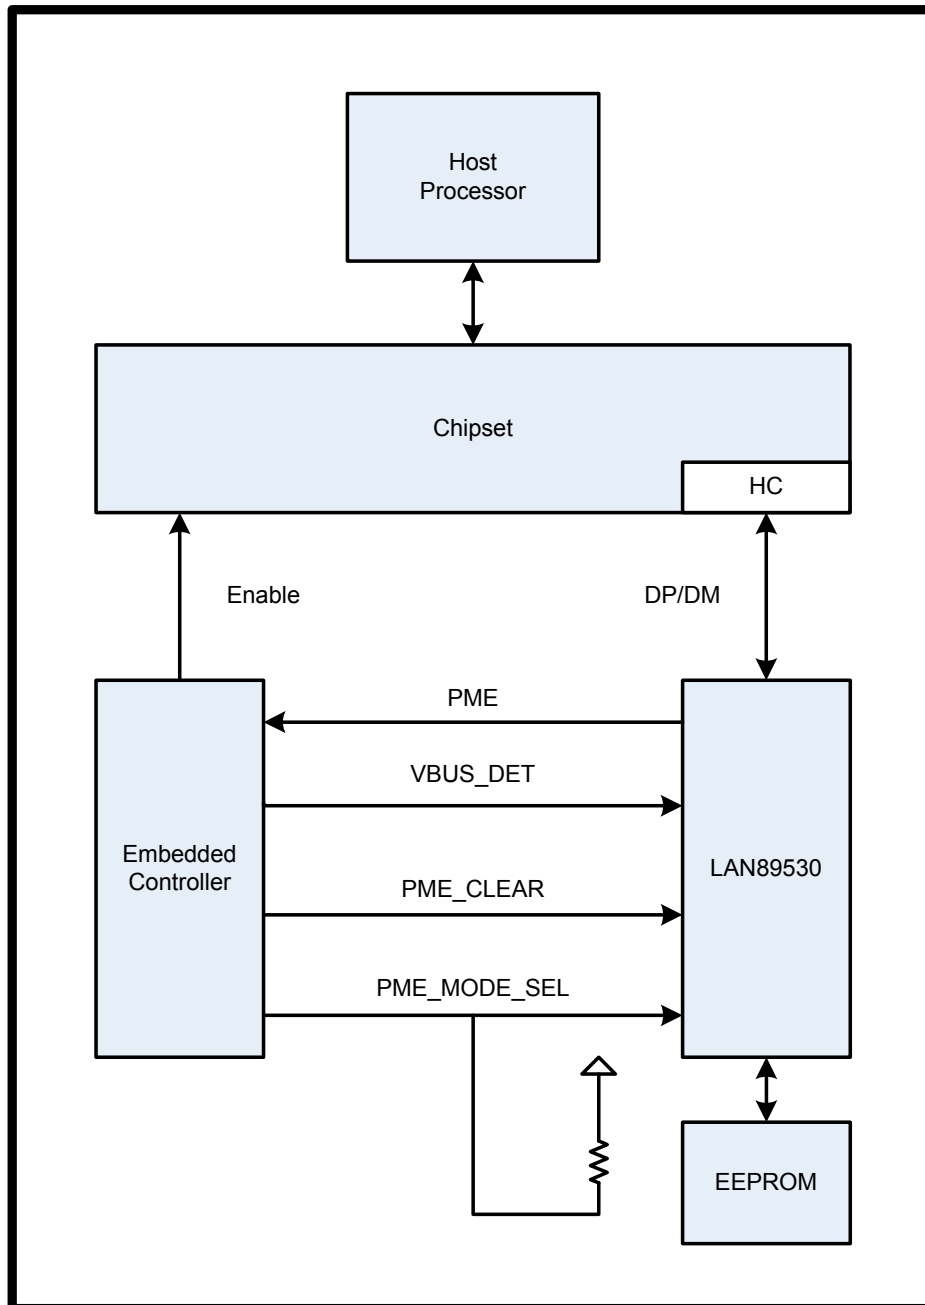

Figure 5.1 Typical Application

The Host processor is connected to a Chipset containing the USB Host Controller (HC). The USB Host Controller interfaces to the device via the DP/DM USB signals. An Embedded Controller (EC) signals the Chipset and the Host processor to power up via an Enable signal. The EC interfaces to the device via four signals. The PME signal is an input to the EC from the device that indicates the occurrence of a wakeup event. The VBUS_DET output of the EC is used to indicate bus power availability. The PME_CLEAR (nRESET) signal is used to clear the PME. The PME_MODE_SEL signal is sampled by the device when PME_CLEAR (nRESET) is asserted and is used by the device to determine whether it should remain in PME Mode or resume normal operation.

GPIO pins are used for PME handling. The pins used depend on the value of the PHY_SEL pin, which determines PHY Mode of operation. In Internal PHY Mode of operation, GPIO0 is reserved for use as an output to signal the PME. GPIO1 is reserved for use as the PME_MODE_SEL input. GPIO8 and GPIO9 are reserved for analogous use, respectively, in External PHY Mode of operation.

The application scenario in Figure 5.1 assumes that the Host processor and the Chipset are powered off, the EC is operational, and the device is in PME Mode, waiting for a wake event to occur. A wake event will result in the device signaling a PME event to the EC, which will then wake up the Host processor and Chipset via the Enable signal. The EC asserts VBUS_DET after the USB bus is powered, sets PME_MODE_SEL to determine whether the device is to begin normal operation or continue in PME Mode, and asserts PME_CLEAR (nRESET) to clear the PME.

The following wake events are supported:

- Wakeup Pin(s)
The GPIO pins not reserved for PME handling have the capability to wake up the device when operating in PME Mode. In order for a GPIO to generate a wake event, its enable bit must be set in the GPIO10:8 Wakeup Enables or GPIO7:0 Wakeup Enables bytes of the EEPROM, as appropriate. During PME Mode of operation, the GPIOs used for signaling (GPIOs 0 and 1 or GPIOs 8 and 9) are not affected by the values set in the corresponding bits of GPIO10:8 Wakeup Enables or GPIO7:0 Wakeup Enables.

GPIO10 is available as a wakeup pin in External PHY Mode, while GPIOs 2-10 are available in Internal PHY Mode. The GPIO10 Detection Select bit in the GPIO PME Flags byte of the EEPROM sets the detection mode for GPIO10 in both External and Internal PHY Mode (if set in GPIO10:8 Wakeup Enables), while GPIOs 2-9 are active low (by default) when operating in Internal PHY Mode.

- Magic Packet
Reception of a Magic Packet when in PME Mode will result in a PME being asserted.
- PHY Link Up
Detection of a PHY link partner when in PME Mode will result in a PME being asserted.

In order to facilitate PME Mode of operation, the GPIO PME Enable bit in the GPIO PME Flags field, must be set and all remaining GPIO PME Flags field bits must be appropriately configured for pulse or level signaling, buffer type and GPIO PME WOL selection. The PME event is signaled on GPIO0 (External PHY Mode) or GPIO8, depending on the PHY Mode of operation.

The PME_MODE_SEL pin (GPIO1 in Internal Mode of operation, GPIO9 in External Mode of operation) must be driven to the value that determines whether or not the device remains in PME Mode of operation (1) or resumes normal operation (0) when the PME is recognized and cleared by the EC via PME_CLEAR (nRESET) assertion.

Note: When in PME Mode, nRESET or POR will always cause the contents of the EEPROM to be reloaded.

Note: GPIO10 may be used in PME and External PHY Mode to connect to an external PHY's Link LED, in order to generate a PHY Link Up wake event.

Datasheet

Figure 5.2 flowcharts PME operation while in Internal PHY Mode. The following conditions hold:

EEPROM Configuration:

- GPIO PME Enable = 1 (enabled)
- GPIO PME Configuration = 0 (PME signaled via level on GPIO pin)
- GPIO PME Length = 0 (NA)
- GPIO PME Polarity = 1 (high level signals event)
- GPIO PME Buffer Type = 1 (push-pull)
- GPIO PME WOL Select = 0 (Magic Packet wakeup)
- GPIO10 Detection Select = 0 (Active-low detection)
- Power Method = 1 (self powered)
- MAC address for Magic Packet

PME signaling configuration (as determined by PHY Mode):

- GPIO0 signals PME
- GPIO1 is PME_MODE_SEL

Note: A POR occurring when PME_MODE_SEL = 1 and an EEPROM present with the GPIO PME Enable set results in the device entering PME Mode.

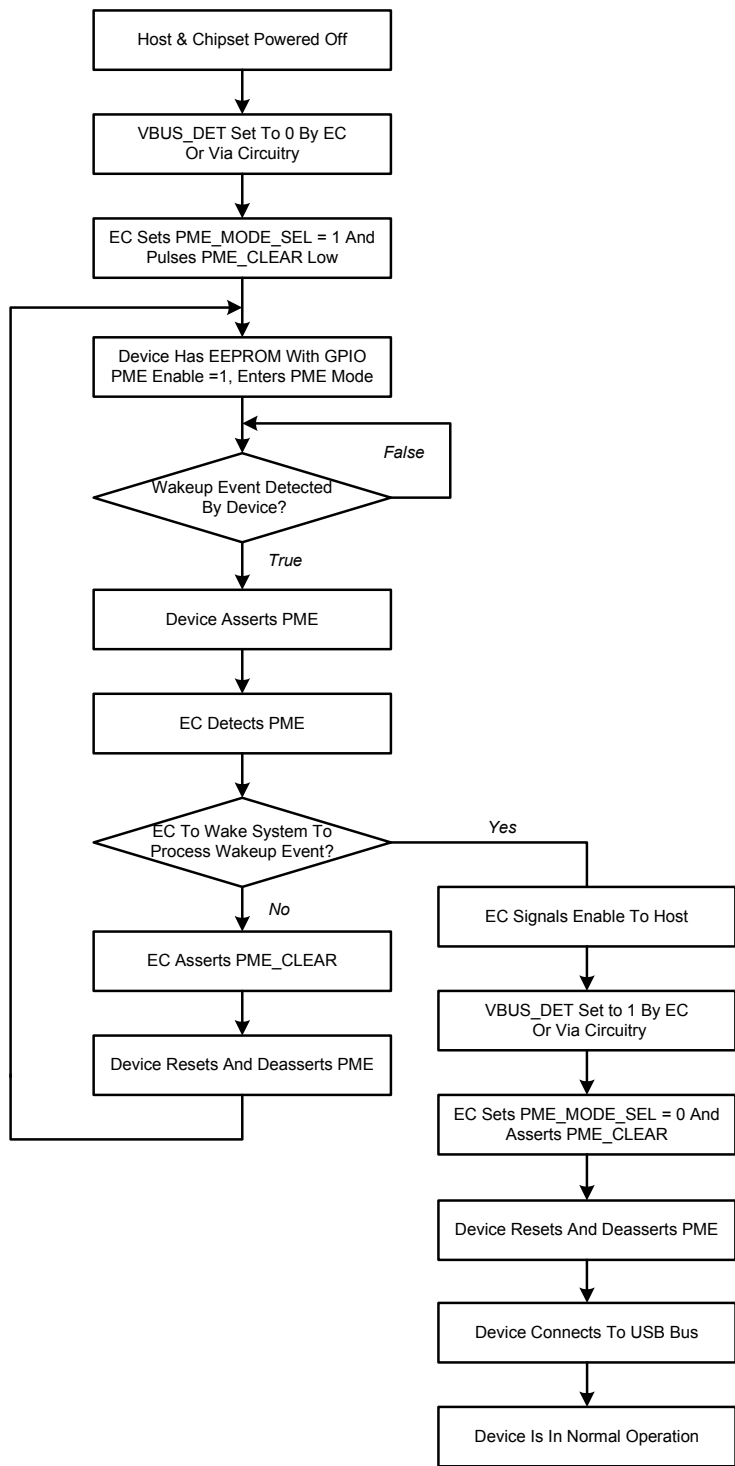

Figure 5.2 PME Operation

Chapter 6 NetDetach Operation

NetDetach is a mode of operation where the device detaches from the USB bus after the Ethernet cable is disconnected. This is advantageous for mobile devices, as an attached USB device may prevent the Host CPU from entering the ACPI C3 state. Allowing the CPU to enter the C3 state maximizes battery life, as the C3 state is the lowest of the four ACPI power states.

When detached, the device is in a low-power state. After the Ethernet cable is reconnected, or a programmed GPIO pin asserts, the device automatically attaches to the USB bus. GPIO pin assertion is supported so that this feature can be used with External PHY Mode. In this case, the external PHY's link LED would be connected to a GPIO.

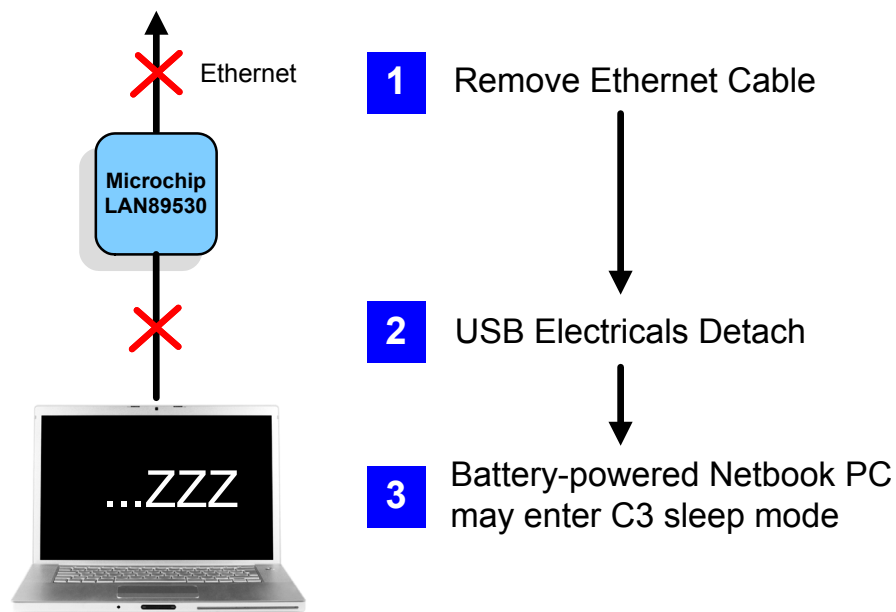

Figure 6.1 Device Detach

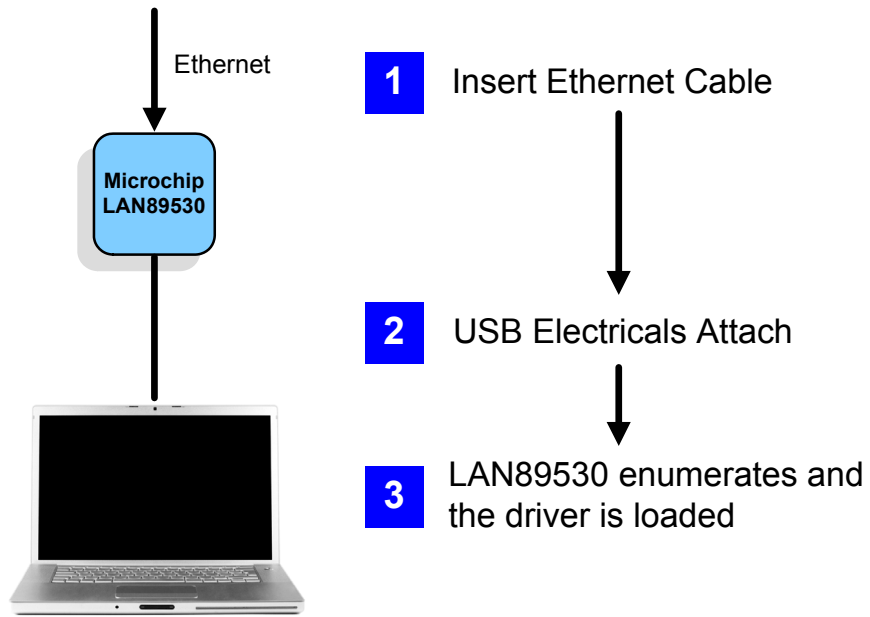

Figure 6.2 Device Attach

Chapter 7 Operational Characteristics

7.1 Absolute Maximum Ratings*

+3.3 V Supply Voltage (VDD33IO, VDD33A) (Note 7.1)	0 V to +3.6 V
+1.2 V Supply Voltage (VDD12CORE, VDD12PLL, VDD12USBPLL) (Note 7.1)	0 V to +1.32 V
Positive voltage on input signal pins, with respect to ground (Note 7.2)	VDD33IO + 0.3 V
Negative voltage on input signal pins, with respect to ground (Note 7.3)	-0.3 V
Positive voltage on XI, with respect to ground	1.26 V
Storage Temperature	-55°C to +150°C
Maximum Junction Temperature Under Bias	+125°C

Note 7.1 Supply voltage ratings are for externally supplied voltages. When powering this device from laboratory or system power supplies, it is important that the absolute maximum ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. If this possibility exists, it is suggested to use a clamp circuit.

Note 7.2 This rating does not apply to the following pins: XI, XO, EXRES, USBRBIAS.

Note 7.3 This rating does not apply to the following pins: EXRES, USBRBIAS.

* Stresses exceeding those listed in this section could cause permanent damage to the device. This is a stress rating only. Functional operation of the device at any condition exceeding those indicated in [Section 7.2, "Operating Conditions**"](#), [Section 7.5, "DC Specifications"](#), or any other applicable section of this specification is not implied. Note, device signals are *NOT* 5 Volt tolerant unless specified otherwise.

7.2 Operating Conditions**

+3.3 V Supply Voltage (VDD33IO, VDD33A)	+3.3 V +/-5%
+1.2 V Supply Voltage (VDD12CORE, VDD12PLL, VDD12USBPLL)	+1.2 V +/-5%
Ambient Operating Temperature in Still Air (T _A)***	-40°C to +85°C

** Supply voltage ratings are for externally supplied voltages. Proper operation of the device is guaranteed only within the ranges specified in this section. If the internal regulator is used, see [Table 7.4](#).

*** Junction temperature must not exceed +125°C.

7.3 Power Consumption

Table 7.1 Power Consumption

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	COMMENTS
Active Mode 100B to HS USB (internal regulator off)						
VDD33IO, VDD33A	IV33I			60	mA	
VDD12CORE, VDD12PLL, VDD12USBPLL	IV12I			100	mA	
Active Mode 100B to HS USB (internal regulator on)						
VDD33IO, VDD33A	IV33			150	mA	
Idle Mode 100B to HS USB (internal regulator off)						
VDD33IO, VDD33A			117		mA	

7.4 Package Thermal Specifications

Table 7.2 Package Thermal Parameters

PARAMETER	SYMBOL	VALUE	UNITS	COMMENTS
Thermal resistance	Θ_{JA}	31.0	$^{\circ}\text{C}/\text{W}$	Measured in still air from the die to ambient air
Junction-to-Top-of-Package	Ψ_{JT}	0.3	$^{\circ}\text{C}/\text{W}$	Measured in still air

Note: Thermal parameters are measured or estimated for devices in a multi-layer 2S2P PCB per JESD51.

Note 7.11 Min/max voltages guaranteed as measured with 100 Ω resistive load.

7.6 AC Specifications

This section details the various AC timing specifications of the device.

Note: The USB DP and USB DM pin timing adheres to the USB 2.0 specification. Refer to the Universal Serial Bus Revision 2.0 specification for detailed USB timing information.

Note: The Ethernet TX/RX pin timing adheres to the IEEE 802.3 specification. Refer to the IEEE 802.3 specification for detailed Ethernet timing information.

7.6.1 Equivalent Test Load

Output timing specifications assume the 25 pF equivalent test load illustrated in [Figure 7.1](#) below, unless otherwise specified.

Figure 7.1 Output Equivalent Test Load

7.6.2 Power Sequence Timing

Power supplies must adhere to the following rules:

- All power supplies of the same voltage must be powered up/down together.
- There is no power-up sequencing requirement, however all power supplies must reach operational levels within the time periods specified in [Table 7.7](#).
- There is no power-down sequencing or timing requirement, however the device must not be powered for an extended period of time without all supplies at operational levels.
- With the exception of VBUS_DET, do not drive input signals without power supplied to the device.

Note: When operating with an external 1.2 V power source, the 1.2 V input must not exceed the 3.3 V source by more than 0.4 V.

Note: Violation of these specifications may damage the device.

Note: A Power-On Reset (POR) occurs whenever power is initially applied to the device, or if power is removed and reapplied to the device. A timer within the device will assert the internal reset for approximately 22 ms.

Note: While the internal power-on reset circuit may assert during brown-out conditions, this is not guaranteed. For proper operation in applications where brown-outs may occur, use of an external reset circuit is recommended.

Figure 7.2 Power Sequence Timing

Table 7.7 Power Sequence Timing Values

SYMBOL	DESCRIPTION	MIN	TYP	MAX	UNITS
t_{pon}	Power supply turn on time	0		25	ms

7.6.3 Power-On Configuration Strap Valid Timing

Figure 7.3 illustrates the configuration strap valid timing requirement in relation to power-on. In order for valid configuration strap values to be read at power-on, the following timing requirements must be met.

Figure 7.3 Power-On Configuration Strap Valid Timing

Table 7.8 Power-On Configuration Strap Valid Timing

SYMBOL	DESCRIPTION	MIN	TYP	MAX	UNITS
t_{cfg}	Configuration strap valid time			15	ms

7.6.4 Reset and Configuration Strap Timing

Figure 7.4 illustrates the nRESET pin timing requirements and its relation to the configuration strap pins and output drive. Assertion of nRESET is not a requirement. However, if used, it must be asserted for the minimum period specified.

Note: For proper operation in applications where brown-outs may occur, use of an external reset circuit is recommended.

Figure 7.4 nRESET Reset Pin Timing

Table 7.9 nRESET Reset Pin Timing Values

SYMBOL	DESCRIPTION	MIN	TYP	MAX	UNITS
t_{rstia}	nRESET input assertion time	1			μ s
t_{css}	Configuration strap pins setup to nRESET deassertion	400			ns
t_{csh}	Configuration strap pins hold after nRESET deassertion	10			ns

7.6.5 EEPROM Timing

The following specifies the EEPROM timing requirements for the device:

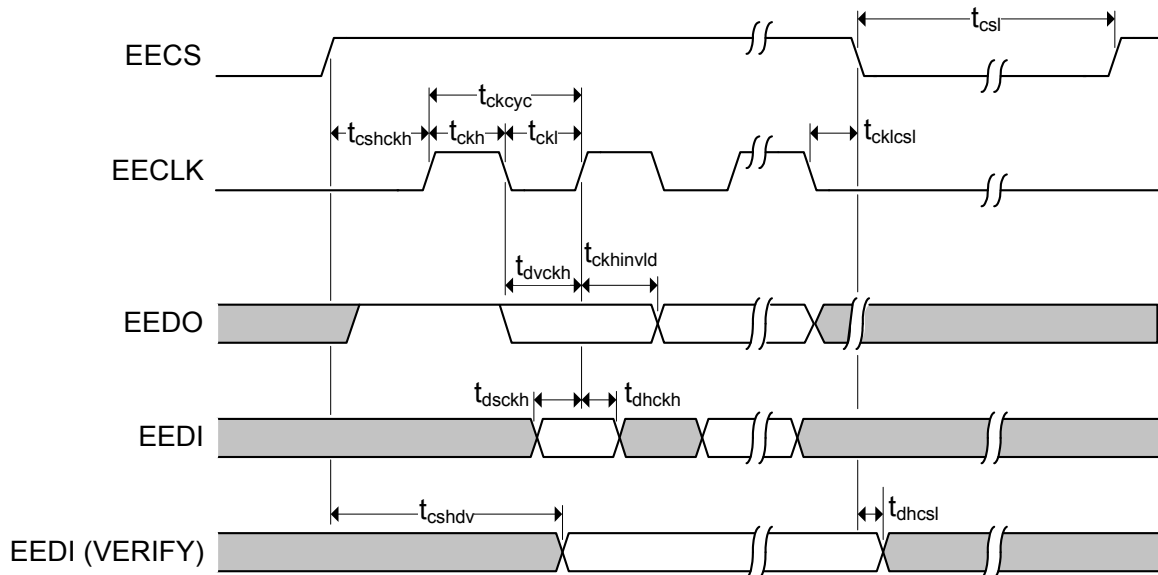

Figure 7.5 EEPROM Timing

Table 7.10 EEPROM Timing Values

SYMBOL	DESCRIPTION	MIN	TYP	MAX	UNITS
t_{ckcyc}	EECLK cycle time	1110		1130	ns
t_{ckh}	EECLK high time	550		570	ns
t_{ckl}	EECLK low time	550		570	ns
t_{cschkh}	EECS high before rising edge of EECLK	1070			ns
t_{cklcsl}	EECLK falling edge to EECS low	30			ns
t_{dvckh}	EEDO valid before rising edge of EECLK	550			ns
$t_{ckhinvid}$	EEDO invalid after rising edge EECLK	550			ns
t_{dsckh}	EEDI setup to rising edge of EECLK	90			ns
t_{dhckh}	EEDI hold after rising edge of EECLK	0			ns
t_{cshdv}	EEDIO valid after EECS high (VERIFY)			600	ns
t_{dhcsl}	EEDIO hold after EECS low (VERIFY)	0			ns
t_{csl}	EECS low	1070			ns

7.6.6 MII Interface Timing

This section specifies the MII interface transmit and receive timing.

Note: The MII timing adheres to the IEEE 802.3 specification. Refer to the IEEE 802.3 specification for additional MII timing information.

Figure 7.6 MII Transmit Timing

Table 7.11 MII Transmit Timing Values

SYMBOL	DESCRIPTION	MIN	MAX	UNITS	NOTES
t_{clkp}	TXCLK period	40		ns	
t_{clkh}	TXCLK high time	$t_{clkp} * 0.4$	$t_{clkp} * 0.6$	ns	
t_{clkl}	TXCLK low time	$t_{clkp} * 0.4$	$t_{clkp} * 0.6$	ns	
t_{val}	TXD[3:0], TXEN output valid from rising edge of TXCLK		22.0	ns	Note 7.12
t_{invid}	TXD[3:0], TXEN output invalid from rising edge of TXCLK	0		ns	Note 7.12

Note 7.12 Timing was designed for a system load between 10 pf and 25 pf.

Datasheet

Figure 7.7 MII Receive Timing

Table 7.12 MII Receive Timing Values

SYMBOL	DESCRIPTION	MIN	MAX	UNITS	NOTES
t_{clkp}	RXCLK period	40		ns	
t_{clkh}	RXCLK high time	$t_{clkp} * 0.4$	$t_{clkp} * 0.6$	ns	
t_{clkl}	RXCLK low time	$t_{clkp} * 0.4$	$t_{clkp} * 0.6$	ns	
t_{su}	RXD[3:0], RXDV setup time to rising edge of RXCLK	8.0		ns	Note 7.13
t_{hold}	RXD[3:0], RXDV hold time after rising edge of RXCLK	9.0		ns	Note 7.13

Note 7.13 Timing was designed for a system load between 10 pf and 25 pf.

7.6.7 JTAG Timing

This section specifies the JTAG timing of the device.

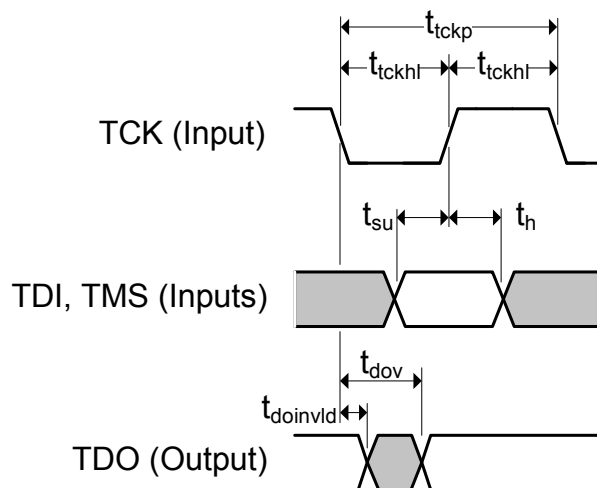

Figure 7.8 JTAG Timing

Table 7.13 JTAG Timing Values

SYMBOL	DESCRIPTION	MIN	MAX	UNITS	NOTES
t_{tckp}	TCK clock period	66.67		ns	
t_{tckhl}	TCK clock high/low time	$t_{tckp} * 0.4$	$t_{tckp} * 0.6$	ns	
t_{su}	TDI, TMS setup to TCK rising edge	10		ns	
t_h	TDI, TMS hold from TCK rising edge	10		ns	
t_{dov}	TDO output valid from TCK falling edge		16	ns	
$t_{doinvld}$	TDO output invalid from TCK falling edge	0		ns	

7.7 Clock Circuit

The device can accept either a 25 MHz crystal (preferred) or a 25 MHz single-ended clock oscillator (+/-50ppm) input. If the single-ended clock oscillator method is implemented, XO should be left unconnected and XI should be driven with a clock that adheres to the specifications outlined throughout [Chapter 7, Operational Characteristics](#). The input clock duty cycle is 40% minimum, 50% typical and 60% maximum.

It is recommended that a crystal utilizing matching parallel load capacitors be used for the crystal input/output signals (XI/XO). See [Table 7.14](#) for the recommended crystal specifications.

Table 7.14 Crystal Specifications

PARAMETER	SYMBOL	MIN	NOM	MAX	UNITS	NOTES
Crystal Cut	AT, typ					
Crystal Oscillation Mode	Fundamental Mode					
Crystal Calibration Mode	Parallel Resonant Mode					
Frequency	F_{fund}	-	25.000	-	MHz	
Frequency Tolerance @ 25°C	F_{tol}	-	-	+/-50	PPM	Note 7.14
Frequency Stability Over Temp	F_{temp}	-	-	+/-50	PPM	Note 7.14
Frequency Deviation Over Time	F_{age}	-	+/-3 to 5	-	PPM	Note 7.15
Total Allowable PPM Budget		-	-	+/-50	PPM	Note 7.16
Shunt Capacitance	C_O	-	7 typ	-	pF	
Load Capacitance	C_L	-	20 typ	-	pF	
Drive Level	P_W	300	-	-	uW	
Equivalent Series Resistance	R_1	-	-	50	Ohm	
Operating Temperature Range		-40	-	+105	°C	
XI Pin Capacitance		-	3 typ	-	pF	Note 7.17
XO Pin Capacitance		-	3 typ	-	pF	Note 7.17

Note 7.14 The maximum allowable values for frequency tolerance and frequency stability are application dependant. Since any particular application must meet the IEEE +/-50 PPM Total PPM Budget, the combination of these two values must be approximately +/-45 PPM (allowing for aging).

Note 7.15 Frequency Deviation Over Time is also referred to as Aging.

Note 7.16 The total deviation for the Transmitter Clock Frequency is specified by IEEE 802.3u as +/-50 PPM.

Note 7.17 This number includes the pad, the bond wire and the lead frame. PCB capacitance is not included in this value. The XO/XI pin and PCB capacitance values are required to accurately calculate the value of the two external load capacitors. These two external load capacitors determine the accuracy of the 25.000 MHz frequency.

Chapter 8 Package Outline

8.1 56-Pin QFN Package

Figure 8.1 56-Pin QFN Package Definition

Table 8.1 56-Pin QFN Dimensions

	MIN	NOMINAL	MAX	REMARKS
A	0.80	0.85	0.90	Overall Package Height
A1	0.00	0.01	0.05	Standoff

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

**QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
= ISO/TS 16949 =**

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
