

GS2924

300mA CMOS LDO Voltage Regulator

Product Description

The GS2924 is a positive voltage output, three-pin regulator that provides a high current even when the input/output voltage differential is small. Low power consumption and high accuracy is achieved through CMOS and laser trimming technologies.

The GS2924 consists of a high-precision voltage reference, an error correction circuit, and a current limited output driver. Transient response to load variations has improved in comparison to the existing series.

SOT-89 and SOT-23-3L packages are available.

Features

- Maximum output current: 300mA
- Output voltage: 1.5V to 5.0V
- Highly accurate: Output voltage $\pm 2\%$ ($\pm 1\%$ for semi-custom products)
- Low power consumption: Typ. $2.0\mu\text{A}$ at $V_{\text{OUT}}=5.0\text{V}$
- Output voltage temperature coefficient $0.1\%/V$: Typ. $\pm 100\text{ppm}/^\circ\text{C}$
- Input stability: Typ. $2.0\%/V$
- Small input/output differential: 0.12V @ $I_{\text{OUT}}=100\text{mA}$ at $V_{\text{OUT}}=5.0\text{V}$
- On-chip protections: thermal, short circuit

Applications

- Wireless Communication Systems
- Battery Powered Systems
- Portable Cameras and Video Recorders
- Voltage Regulator for Microprocessor
- Palmtops
- Voltage Regulator for CD-ROM Drivers, LAN Cards, 56K Modem

NOTES ON USE

1. There is a possibility that oscillation may occur as a result of the impedance present between the power supply and the IC's input. Where impedance is 10Ω or more, please use a capacitor (C_{IN}) of at least $1\mu F$. With a large output current, operations can be stabilized by increasing capacitor size (C_{IN}). If C_{IN} is small and capacitor size (C_L) is increased, there is a possibility of oscillation due to input impedance. In such cases, either increasing the size of C_{IN} or decreasing the size of C_L can stabilize operations.
2. Please ensure that output current (I_{OUT}) is less than $P_D + (V_{IN} - V_{OUT})$ and does not exceed the stipulated Continuous Total Power Dissipation value (P_D).
