

NCV8461

Self Protected High Side Driver with Temperature Shutdown and Current Limit

The NCV8461 is a fully protected High-Side driver that can be used to switch a wide variety of loads, such as bulbs, solenoids and other activators. The device is internally protected from an overload condition by an active current limit and thermal shutdown. A diagnostic output reports OFF state open load conditions as well as thermal shutdown.

Features

- Short Circuit Protection
- Thermal Shutdown with Automatic Restart
- CMOS (3 V / 5 V) Compatible Control Input
- Off State Open Load Detection
- Open Drain Diagnostic Output
- Overvoltage Protection
- Undervoltage Shutdown
- Loss of Ground and Loss of V_D Protection
- ESD Protection
- Reverse Battery Protection (with external resistor)
- Very Low Standby Current
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- This is a Pb-Free Device

Typical Applications

- Switch a Variety of Resistive, Inductive and Capacitive Loads
- Can Replace Electromechanical Relays and Discrete Circuits
- Automotive / Industrial

REVERSE BATTERY PROTECTION

The NCV8461 provides reverse battery protection up to 32 V. This protection requires a Resistor in the GND path. The recommended GND resistor is 150 Ω , but a variety of resistor values can be chosen for this purpose. The graph below shows the considerations and constraints for selection of the GND resistor. Figure 2 shows the power dissipation in the GND resistor during a 32 V reverse battery event on the left axis, while the right axis shows the voltage drop

across the GND resistor while in normal operation. The far right side of the graph is grayed out to indicate that the voltage drop across the resistor is too high, and the part will not be able to turn on with a standard 5 V on the input pin. Selection of the optimal GND resistor requires balancing the power dissipation considerations while in a reverse battery event, with the turn on capability of the input signal during normal operation.
