

TS4601B

High performance stereo headphone amplifier with capacitorless outputs and I²C bus interface

Features

- Power supply range: 2.9 V to 5.5 V
- 107 dB of PSRR at 217 Hz
- Fully differential inputs
- I²C interface for volume control
- Digital volume control range from -60 dB to +4 dB
- 101 dB of SNR A-weighted
- Independent right and left channel shutdown control
- Low quiescent current: 4.8 mA typ. at 3.0 V
- Low standby current: 2 µA max
- Output-coupling capacitors removed
- Flip-chip package 2.1 mm x 2.1 mm, 500 µm pitch, 16 bumps

Applications

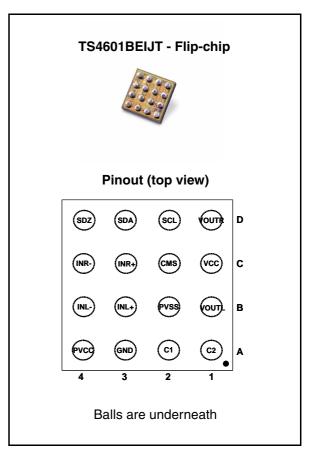

- Cellular phones
- Notebook computers
- CD/MP3 players

Description

The TS4601B is a stereo headphone driver dedicated to high audio performance and spaceconstrained applications. It has the same uses as the TS4601 which it replaces, while offering highly improved ESD ratings.

It is based on low power dissipation amplifier core technology. Special care was taken in the design of the amplification chain to achieve peerless PSRR (107 dB typ. at 217 Hz) and 101 dB of SNR.

The TS4601B can drive 0.9 V_{rms} output voltage into 16 Ω and 1.6 V_{rms} into 10 k Ω , whatever the power supply voltage, in the 2.9 V to 5.5 V range.

An I²C interface offers volume control in 64 steps from -60 dB to +4 dB and multiple configuration modes for the device.

The traditionally used output-coupling capacitors can be removed and a dedicated common-mode sense pin removes parasitic noise from the jack.

The TS4601B is designed to be used with an output serial resistor. It ensures unconditional stability over a wide range of capacitive loads.

The TS4601B is packaged in a tiny 16-bump flipchip with a pitch of 500 μm and a 300 μm diameter ball size.

----------	---------------------------------

Pin number	Pin name	Pin definition
C1	VCC	Analog supply voltage, connect to V _{battery}
A4	PVCC	Power supply voltage, connect to V _{battery} .
A2	C1	Capacitor terminal for internal negative supply generator.
A1	C2	Capacitor terminal for internal negative supply generator.
B2	PVSS	Capacitor terminal for internal negative supply generator filtering.
D1	VOUTR	Right audio channel output signal.
B1	VOUTL	Left audio channel output signal.
A3	GND	Ground of the device.
C2	CMS	Common-mode sense, to be connected as close as possible to the ground of headphone / line out plug.
B4	INL-	Left audio channel negative input signal.
B3	INL+	Left audio channel positive input signal.
D4	SDZ	Master standby of the circuit. When SDZ = 0, the device is also reset to initial state. Up to V_{CC} tolerant input.
C4	INR-	Right audio channel negative input signal.

Pin number	Pin name	Pin definition	
C3	INR+	Right audio channel positive input signal.	
D3	SDA	I ² C signal data. Up to V_{CC} tolerant input.	
D2	SCL	I ² C clock signal. Up to V_{CC} tolerant input.	

Table 3. Pin description for the TS4601B (continued)

Table 4.Component description for the TS4601B

Component	Value	Description
Cs	1µF	Decoupling capacitors for V _{CC} and PV _{CC} . Two 1µF capacitors are enough for proper decoupling of TS4601B. X5R dielectric and 10V rating voltage is recommended to minimize $\Delta C/\Delta V$ when V _{CC} = 5V. Must be placed as close as possible to the TS4601B to minimize parasitic inductance and resistance.
C12	1µF	Capacitor for internal negative power supply operation. X5R dielectric and 10V rating voltage is recommended to minimize $\Delta C/\Delta V$ when V _{CC} = 5V. Must be placed as close as possible to the TS4601B to minimize parasitic inductance and resistance.
C _{SS}	2.2µF	Filtering capacitor for internal negative power supply. X5R dielectric and 10V rating voltage is recommended to minimize $\Delta C/\Delta V$ when V _{CC} = 5V.
C _{in}	$Cin = \frac{1}{2\pi ZinFc}$	Input coupling capacitor that forms with Z_{in} , a first order high pass filter with a -3dB cut-off frequency F_C . Z_{in} is $12k\Omega$ typical and independent of the gain setting. For example $F_C = 13Hz$, $C_{in} = 1\mu$ F and for $F_C = 6Hz$, $C_{in} = 2.2\mu$ F
C _{out}	0.8nF to 100nF	Output capacitor of 0.8nF minimum to 100nF maximum. This capacitor is mandatory for operation of the TS4601B.
R _{out}	12Ω min.	Output resistor in series with the TS4601B output. This $12\Omegaminimum$ resistor is mandatory for operation of the TS4601B.

4 Application information

4.1 Common-mode sense

The TS4601B implements a common-mode sense to correct the voltage differences that might occur between the headphone jack return and the GND of the device, thus creating parasitic noise in the headphone and/or line-out.

The solution to strongly reduce and practically eliminate this noise, is to connect the headphone jack ground to the CMS of the device that is a common-mode sense pin. It will sense the difference of potential (voltage noise) between the TS4601B ground and headphone ground. Thanks to CMS frequency response (refer to *Figure 46 on page 16*), this noise is removed from the TS4601B outputs. *Figure 1: Typical application schematics for the TS4601B* illustrates this connection.

4.2 I²C bus interface

In compliance with the I²C protocol, the TS4601B uses a serial bus to control the chip's functions with two wires: Clock (SCL) and Data (SDA). The clock line and the data line are bi-directional (open-collector) with an external chip pull-up resistor (typically 10 k Ω). The maximum clock frequency in fast-mode specified by the I²C standard is 400 kHz, which TS4601B supports. In this application, the TS4601B is always the slave device and the controlling microcontroller MCU is the master device.

The slave address of the TS4601B is 1100 000x (C0h).

An SDZ pin is available to shut down the circuit from a master MCU.

Table 7 summarizes the pin descriptions for the I²C bus interface.

Master standby of the TS4601B

•								
	Pin	Functional description						
	SDA	Serial data pin						
	SCL	Clock input pin						

Table 7. I²C bus interface pin descriptions

4.2.1 I²C bus operation

SDZ

The host MCU can write into the TS4601B control register to control the TS4601B, and read from the control register to get a configuration from the TS4601B. The TS4601B is addressed by the byte consisting of the 7-bit slave address and R/\overline{W} bit.

Table 8.	The first byte after the START message for addressing the device
----------	--

A6	A5	A4	A3	A2	A1	A0	R/W
1	1	0	0	0	0	0	Х

There are five control registers (see *Table 9*) named CR0 to CR4. In read mode, all the control registers can be accessed. In write mode, only CR1 and CR2 can be addressed.

Description	D7	D6	D5	D4	D3	D2	D1	D0
CR0	SC_L	SC_R	T_SH	0	0	0	0	0
CR1 - modes	0	utput mode	es	0	0	0	0	0
CR2 - volume control	Mute_L Mute_R			Volume control				
CR3	0	0	0	0	0	0	0	0
CR4 - identification	0	1	0	0	0	0	1	0

Table 9. Control registers summary

To write in the control registers:

In order to write data into the TS4601B, after the "start" message, the MCU must:

- send byte with the I²C 7-bit slave address and with a low level for the R/W bit
- send the data (control register setting)

All bytes are sent with MSB first. The transfer of written data ends with a "stop" message. When transmitting several data, the data can be written with no need to repeat the "start" message and addressing byte with the slave address.

When writing several bytes, the data is transmitted as follows:

CR1 CR2 CR2 CR2... this is an advantage for a fast increase/decrease of the volume control.

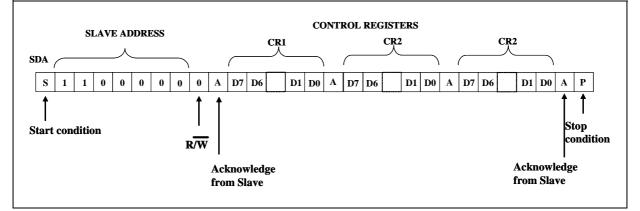

Figure 50. I²C write operations

To read from the control registers:

In order to read data from the TS4601B, after the "start" message, the MCU must:

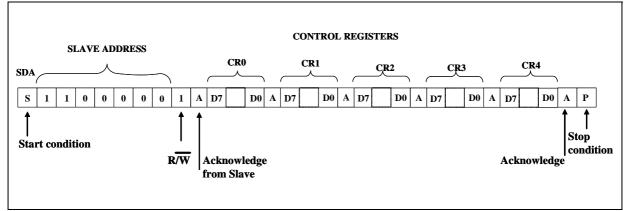

- send byte with the I²C 7-bit slave address and with a high level for the R/W bit
- receive the data (control register value)

All bytes are read with MSB first. The transfer of read data ends with the "stop" message. When transmitting several data, the data can be read with no need to repeat the "start" message and the byte with the slave address. In this case, the value of the control register is read repeatedly, CR0, CR1, CR2, CR3, CR4, CR0, CR1 etc.

SD

SD

The TS4601B can be set to standby in two different ways:

- A master standby from an MCU using SDZ input, can set the TS4601B in master standby. The lowest current consumption (I_{stby} =2 µA maximum) is achieved with a 0 V on SDZ. At 0.63 V, I_{stby} is 20 μA maximum. Note that the SDZ input has a 600 k Ω +/-20% pull-down resistor. If VSDZ > 0 V, an additional current consumption has to be taken into consideration and provided by the MCU IO. This additional current is V_{SDZ} /600k Ω (+/-20%). During master standby mode, amplifiers, power management and I²C part are disabled thus offering the most current-saving standby mode.
- The TS4601B can also be set to I²C standby by an I²C command. In this case the I_{stby} is slightly higher and is I_{stbv}=75 µA maximum (including current consumption on SDA and SCL inputs).

When the TS4601B is in Master standby or I²C standby mode (on one or both channels), the corresponding amplifier output is forced to ground through a 16 Ω resistor. In mode 5, in which amplifiers are inactive but the power management part is active, the amplifier outputs are in high impedance state to allow line in function.

 Table 11.
 Volume control register - CR2

In the volume register, MUTE_L, and MUTE_R are dedicated bits to enable the mute independently from the channel. When MUTE_L, MUTE_R are set to VIH, the mute function is enabled on the corresponding channel. When MUTE_L, MUTE_R are set to VIL, the gain level is applied to the channel.

Control register CR0

Amplifier output short-circuit detection:

The outputs of the amplifier are protected against short-circuits that might occur accidentally during manipulation of the device. In the typical application, if a short-circuit arises on the jack plug, there is no detection due to the serial resistor present on the amplifier output, thus the output current threshold is not reached.

To be active, the detection has to occur directly on the amplifier output with a signal modulation on the inputs of the TS4601B.

If a short-circuit is detected on one channel, a flag is raised in the I²C read register CR0.

- SC_L: equals 0 during normal operation, equals 1 when a short-circuit is detected on the left channel
- SC_R: equals 0 during normal operation, equals 1 when a short-circuit is detected on the right channel

The corresponding channel output stage is then set to high impedance mode. An I²C read command allows the reading of the SC_L and SC_R flags but does not reset them. An I²C write command has to be sent to reset the flags to 0 and restore normal operation.

When the TS4601B is in I²C standby mode, the SC_L and SC_R flags are in an undetermined state.

Thermal shutdown protection:

A thermal shutdown protection is implemented to protect the device from overheating. If the temperature rises above the thermal junction of 150°C, the device is put into standby mode and a flag is raised in the read register CR0.

 T_SH: equals 0 during normal operation, equals 1 when a thermal shutdown is detected.

When the temperature decreases to safe levels, the circuit switches back to normal operation and the corresponding flag is cleared.

4.3 Wake-up and standby time definition

The wake-up time of the TS4601B is guaranteed at 12 ms typical (refer to Section 3.1: Electrical characteristics tables on page 6). However, as the TS4601B is activated with an I^2C bus, the wake-up start procedure is as follows:

- 1. The master sends a start bit
- 2. The master sends the address.
- 3. The slave (TS4601B) answers by an acknowledge.
- 4. The master sends the output mode configuration (CR1).
- 5. If the TS4601B was in I²C standby (mode 1, 6, 7), the wake-up starts on the falling edge of the eighth clock signal (SCL) corresponding to CR1 byte.
- 6. 12 ms after (de-pop sequence time), the TS4601B outputs are operational.

The standby time is guaranteed as 10 μ s typical (refer to *Section 3.1: Electrical characteristics tables on page 6*). However, as the TS4601B is de-activated with an I²C bus, the standby time operates as follows:

- 1. The master sends a start bit
- 2. The master sends the address.
- 3. The slave (TS4601B) answers by an acknowledge.
- 4. The master sends the output mode configuration (CR1) and in this case it corresponds to mode 1, 6, 7.
- 5. The standby time starts on the falling edge of the eighth clock signal (SCL) corresponding to CR1 byte.
- 6. After 10 μ s, the TS4601B is in standby mode.

4.4 Decoupling considerations

The TS4601B needs two decoupling capacitors for the positive power supply (battery) and two capacitors for normal operation of the internal negative supply (refer to *Figure 1: Typical application schematics for the TS4601B on page 4*). These capacitors must be placed as close as possible of the TS4601B to minimize parasitic inductance and resistance that have a negative impact on audio performance.

Two decoupling capacitors (Cs) of 1 μ F and low ESR are recommended for positive power supply decoupling. Packages like the 0402 or 0603 are also recommended because the placement close to TS4601B is easier. X5R dielectric for capacitor tolerance behavior and 10 V DC rating voltage for 5 V operation or 6.3 V DC rating operation for 3.6 V operation to take into consideration the $\Delta C/\Delta V$ variation of this type of dielectric.

Two decoupling capacitors (C12 and Css) of respectively 1 μ F and 2.2 μ F and low ESR are recommended for internal negative power supply decoupling. Packages like the 0402 or 0603 are also recommended because the placement close to TS4601B is easier. X5R dielectric for capacitor tolerance behavior and 10 V DC rating voltage for 5 V operation or 6.3 V DC rating operation for 3.6 V operation to take into consideration the Δ C/ Δ V variation of this type of dielectric.

4.5 Low frequency response

Input coupling capacitors C_{in} (see *Figure 1: Typical application schematics for the TS4601B on page 4*) are mandatory for TS4601B operation. C_{in} with Z_{in} (see *Section 3.1: Electrical characteristics tables on page 6*) form a first order high pass filter and the -3 dB cut-off frequency is:

$$F_{c}(-3dB) = \frac{1}{2\pi Z_{in}C_{in}}$$

Z_{in} is the single-ended input impedance.

Because Z_{in} is independent from the gain setting, determining the appropriate C_{in} is very simple. However, the tolerance of Z_{in} (refer to *Section 3.1: Electrical characteristics tables on page 6*) must be taken into consideration for determining C_{in} .

Therefore, for a given F_c , the value of C_{in} is given by the following equation:

$$\left(\mathsf{C}_{\mathsf{in}_{\mathsf{min}}} = \frac{16}{\mathsf{F}_{\mathsf{c}}}\right) \not = \left(\mathsf{C}_{\mathsf{in}_{\mathsf{typ}}} = \frac{13.3}{\mathsf{F}_{\mathsf{c}}}\right) \not = \left(\mathsf{C}_{\mathsf{in}_{\mathsf{max}}} = \frac{11}{\mathsf{F}_{\mathsf{c}}}\right)$$

(With C_{in} in μF and F_c in Hz).

4.6 Low pass output filter

The TS4601B is designed to operate with a passive first order low pass filter (see *Figure 1: Typical application schematics for the TS4601B on page 4*). This low pass filter is mandatory to ensure stability of the TS4601B.

 R_{out} must have a value of 12 Ω minimum and C_{out} a value of 0.8 nF minimum up to 100 nF maximum. Values of 12 Ω and 1 nF are a good start point for a design able to drive a classic headphone (16 Ω 32 Ω 60 Ω) and the line-in of any Hi-fi system or sound card. The cut-off frequency of this filter (12 Ω and 1 nF) is about 13 MHz and clearly above the audio band.

4.7 Single-ended input configuration

The TS4601B can be used in single-ended input configuration. InR- and InL- must be shorted to ground through input capacitors. All C_{in} capacitors must have the same value to keep the same PSRR performance as in differential input configuration. *Figure 52* shows an example.

Figure 52. Typical application schematics for the TS4601B in single-ended input

The gain in this configuration is given by:

$$Gain(dB) = 20log\left(\frac{V_{outL}}{V_{inputLeft}}\right)$$

or:

$$Gain(dB) = 20log\left(\frac{V_{outR}}{V_{inputRight}}\right)$$

5 Package information

In order to meet environmental requirements, STMicroelectronics offers these devices in ECOPACK[®] packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an STMicroelectronics trademark. ECOPACK specifications are available at: <u>www.st.com</u>.

6 Ordering information

Table 12. Order codes

Order code	Temperature range	Package	Packing	Marking
TS4601BEIJT	-40° C to +85° C	Flip-chip	Tape & reel	B1

7 Revision history

Table 13. Document revision history

Date	Revision	Changes
03-Jun-2008	1	Initial release of TS4601B. Identical to TS4601 except for improved ESD ratings.
08-Jul-2008	2	Corrected typographical error on page 1.
