#### **General Description**

MAX6685/MAX6686 are dual-output temperature switches that use an external diode-connected transistor as a sensing element. These devices have two logic outputs (T<sub>HIGH</sub> and T<sub>LOW</sub>). T<sub>HIGH</sub> asserts a logic signal when the remote temperature crosses the factory-programmed, +120°C, or +125°C upper trip threshold. T<sub>LOW</sub> is asserted when the remote temperature exceeds the lower threshold, which is controlled by pins S1 and S2. The lower thresholds are available in two ranges in 5°C increments. The two ranges are +40°C to +80°C and +75°C to +115°C. Hysteresis for both outputs to be deasserted is typically 5°C.

Thigh is an open-drain, active-low output for both the MAX6685 and the MAX6686. TLOW is a CMOS push-pull, active-high output for the MAX6685 and is an open-drain, active-low output for the MAX6686. They are available in a space-saving 8-pin  $\mu$ MAX package.

#### \_Applications

CPU TemperatureMultichip ModulesProtectionFPGA TemperatureFan ControlProtection

#### \_Features

- Pin-Programmed Lower Temperature Threshold from +40°C to +80°C or +75°C to +115°C (5°C Increments)
- Preset Upper Threshold: +120°C or +125°C
- Open-Drain, Active-Low Output for Upper Temperature Alarm
- CMOS Push-Pull, Active-High or Open-Drain, Active-Low Output for Lower Temperature Alarm
- ♦ 1.5°C Accuracy
- ♦ 3.0V to 5.5V, 200µA Supply
- ♦ 8-Pin µMAX Package

Pin Configurations appear at end of data sheet.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

| 3       | 3       | DXP              | This pin connects to the positive (anode) terminal of the external P-N sense junction. It sources current into the external junction. A 2200pF capacitor should be connected across DXP and DXN.   |  |  |  |
| 4       | 4       | DXN              | This pin connects to the negative (cathode) terminal of the external P-N sense junction. It sinks current from the external junction. A 2200pF capacitor should be connected across DXP and DXN. DXN must be connected to the GND pin with the shortest possible connection.                       |  |  |  |
| 5       | 5       | THIGH            | Open-Drain, Active-Low Output. $\overline{T_{HIGH}}$ goes low when the temperature exceeds the factory-<br>programmed upper temperature threshold, either +120°C or +125°C. Connect a pullup resistor<br>(typically 10k $\Omega$ ) between $\overline{T_{HIGH}}$ and a positive supply up to 5.5V. |  |  |  |
| 6       | _       | T <sub>LOW</sub> | CMOS Push-Pull, Active-High Output. T <sub>LOW</sub> goes HIGH when the temperature exceeds the pin-<br>programmed lower temperature threshold.  |  |  |  |
|         | 6       | TLOW             | Open-Drain, Active-Low Output. $\overline{T_{LOW}}$ goes LOW when the temperature exceeds the pin-<br>programmed lower temperature threshold. Connect a pullup resistor (typically 10k $\Omega$ ) between $\overline{T_{LOW}}$ and a positive supply up to 5.5V.                                   |  |  |  |
| 7       | 7       | S1               | Threshold Select Input. Used in conjunction with S2 to set the lower threshold for $T_{LOW}$ (Table 1). It can be connected to $V_{DD}$ , GND, or left floating.   |  |  |  |
| 8       | 8       | S2               | Threshold Select Input. Used in conjunction with S1 to set the lower threshold for $T_{LOW}$ (Table 1). It can be connected to $V_{DD}$ , GND, or left floating.   |  |  |  |

#### **Detailed Description**

The MAX6685/MAX6686 dual-output remote-sensing junction temperature switches incorporate a precision remote-junction temperature sensor and two comparators. These devices use an external P-N junction as the temperature-sensing element (see *Typical Operating Circuits*).

The MAX6685/MAX6686 provide noise immunity by integration and oversampling of the diode voltage, but good design practice includes routing the DXP and DXN lines away from noise sources, such as high-speed digital lines, switching regulators, inductors, and transformers. The DXP and DXN traces should be paired together and surrounded by a ground plane whenever possible.

The 5°C hysteresis keeps the outputs from "chattering" when the measured temperature is close to the threshold temperature. The MAX6685/MAX6686 are available with preset upper temperature thresholds of +120°C or +125°C. The lower temperature thresholds are pin programmable in 5°C increments (Table 1). Two tempera-

ture ranges are available for the lower trip threshold:  $+40^{\circ}$ C to  $+80^{\circ}$ C and  $+75^{\circ}$ C to  $+115^{\circ}$ C. S1 and S2 pins must be set to the desired trip temperature before power is applied to the V<sub>DD</sub> pin. If this is done after the power is turned on, the lower trip threshold remains set to the point where S1 and S2 were when power was applied.

#### **Applications Information**

#### **Remote-Diode Selection**

The MAX6685/MAX6686 are optimized to measure the die temperature of CPUs and other ICs that have on-chip temperature-sensing diodes. These on-chip diodes are substrate PNPs with their collectors grounded. Connect the base of the PNP to DXN and the emitter to DXP. When using a discrete, diode-connected NPN or PNP as a sensing diode, use a good-quality small-signal device. Examples are listed in Table 2. Tight specifications for forward current gain indicate the manufacturer has good process controls and that the devices have consistent V<sub>be</sub> characteristics. Always use a transistor for the sensing junction; diodes do not work.

#### Table 1. Lower Temperature Trip Threshold Selection

| S1              | S2              | MAX6685AUA40L<br>MAX6685AUA40H<br>MAX6686AUA40L<br>MAX6686AUA40H<br>LOWER TEMPERATURE<br>TRIP THRESHOLD (°C) | MAX6685AUA75L<br>MAX6685AUA75H<br>MAX6686AUA75L<br>MAX6686AUA75H<br>LOWER TEMPERATURE<br>TRIP THRESHOLD (°C) |
|-----------------|-----------------|--|--|

| GND             | V <sub>DD</sub> | +50  | +85  |
| FLOAT           | GND             | +55  | +90  |
| FLOAT           | FLOAT           | +60  | +95  |
| FLOAT           | V <sub>DD</sub> | +65  | +100   |
| V <sub>DD</sub> | GND             | +70  | +105   |
| V <sub>DD</sub> | FLOAT           | +75  | +110   |
| V <sub>DD</sub> | V <sub>DD</sub> | +80  | +115   |

#### **Noise-Filtering Capacitors**

A quality ceramic capacitor must be connected across the DXP/DXN inputs to maintain temperature threshold accuracy by filtering out noise. The capacitor should be located physically close to the DXP/DXN pins and should typically have a value of 2200pF. Larger capacitor values can cause temperature measurement errors. A 50% variation from the recommended capacitor value can cause up to  $\pm 1^{\circ}$ C error.

#### Table 2. Sensor Transistor Manufacturers

| MANUFACTURER                | MODEL NO.      |
|-----------------------------|----------------|
| Central Semiconductor (USA) | CMPT3904       |
