## Parallel RTC With CPU Supervisor

### Features

- Real-Time Clock counts seconds through years in BCD format
- On-chip battery-backup switchover circuit with nonvolatile control for external SRAM
- Less than 500nA of clock operation current in backup mode
- Microprocessor reset valid to  $V_{CC} = V_{SS}$
- Independent watchdog timer with a programmable time-out period
- Power-fail interrupt warning
- Programmable clock alarm interrupt active in battery-backup mode
- Programmable periodic interrupt
- Battery-low warning

### General Description

The bq4845 Real-Time Clock is a low-power microprocessor peripheral that integrates a time-of-day clock, a 100-year calendar, and a CPU supervisor in a 28-pin SOIC or DIP. The bq4845 is ideal for fax machines, copiers, industrial control systems, point-of-sale terminals, data loggers, and computers.

The bq4845 provides direct connections for a 32.768KHz quartz crystal and a 3V backup battery. Through the use of the conditional chip enable output ( $\overline{CE}_{OUT}$ ) and battery voltage output ( $V_{OUT}$ ) pins, the bq4845 can write-protect and make nonvolatile external SRAMs. The backup cell powers the real-time clock and maintains SRAM information in the absence of system voltage.

The bq4845 contains a temperature-compensated reference and comparator circuit that monitors the status of its voltage supply. When the bq4845 de-

fects an out-of-tolerance condition, it generates an interrupt warning and subsequently a microprocessor reset. The reset stays active for 200ms after  $V_{CC}$  rises within tolerance, to allow for power supply and processor stabilization.

The bq4845 also has a built-in watchdog timer to monitor processor operation. If the microprocessor does not toggle the watchdog input ( $\overline{WDI}$ ) within the programmed time-out period, the bq4845 asserts  $\overline{WDO}$  and  $\overline{RST}$ .  $\overline{WDI}$  unconnected disables the watchdog timer.

The bq4845 can generate other interrupts based on a clock alarm condition or a periodic setting. The alarm interrupt can be set to occur from once per second to once per month. The alarm can be made active in the battery-backup mode to serve as a system wake-up call. For interrupts at a rate beyond once per second, the periodic interrupt can be programmed with periods of 30.5 $\mu$ s to 500ms.

## Pin Descriptions

### X1-X2 Crystal inputs

X1-X2 are a direct connection for a 32.768kHz, 6pF crystal.

### $\overline{\text{RST}}$ Reset output

$\overline{\text{RST}}$  goes low whenever  $V_{CC}$  falls below the power fail threshold.  $\overline{\text{RST}}$  will remain low for 200ms typical after  $V_{CC}$  crosses the threshold on power-up.  $\overline{\text{RST}}$  also goes low whenever a watchdog timeout occurs.  $\overline{\text{RST}}$  is an open-drain output.

### $\overline{\text{INT}}$ Interrupt output

$\overline{\text{INT}}$  goes low when a power fail, periodic, or alarm condition occurs.  $\overline{\text{INT}}$  is an open-drain output.

### WDI Watchdog input

WDI is a three-level input. If WDI remains either high or low for longer than the watchdog time-out period (1.5 seconds default),  $\overline{\text{WDO}}$  goes low.  $\overline{\text{WDO}}$  remains low until the next transition at WDI. Leaving WDI unconnected disables the watchdog function. WDI connects to an internal voltage divider between  $V_{OUT}$  and  $V_{SS}$ , which sets it to mid-supply when left unconnected.

### $\overline{\text{WDO}}$ Watchdog output

$\overline{\text{WDO}}$  goes low if WDI remains either high or low longer than the watchdog time-out period.  $\overline{\text{WDO}}$  returns high on the next transition at WDI.  $\overline{\text{WDO}}$  remains high if WDI is unconnected.

### A<sub>0</sub>-A<sub>3</sub> Clock address inputs

A<sub>0</sub>-A<sub>3</sub> allow access to the 16 bytes of real-time clock and control registers.

### DQ<sub>0</sub>-DQ<sub>7</sub> Data input and output

DQ<sub>0</sub>-DQ<sub>7</sub> provide x8 data for real-time clock information. These pins connect to the memory data bus.

### V<sub>SS</sub> Ground

### $\overline{\text{CS}}$ Chip select

### $\overline{\text{OE}}$ Output enable

$\overline{\text{OE}}$  provides the read control for the RTC memory locations.

### $\overline{\text{CE}}_{OUT}$ Chip enable output

$\overline{\text{CE}}_{OUT}$  goes low only when  $\overline{\text{CE}}_{IN}$  is low and  $V_{CC}$  is above the power fail threshold. If  $\overline{\text{CE}}_{IN}$  is low, and power fail occurs,  $\overline{\text{CE}}_{OUT}$  stays low for 100 $\mu$ s or until  $\overline{\text{CE}}_{IN}$  goes high, whichever occurs first.

### $\overline{\text{CE}}_{IN}$ Chip enable input

$\overline{\text{CE}}_{IN}$  is the input to the chip-enable gating circuit.

### BC Backup battery input

BC should be connected to a 3V backup cell. A voltage within the  $V_{BC}$  range on the BC pin should be present upon power up to provide proper oscillator start-up.

### V<sub>OUT</sub> Output supply voltage

$V_{OUT}$  provides the higher of  $V_{CC}$  or  $V_{BC}$ , switched internally, to supply external RAM.

### $\overline{\text{WE}}$ Write enable

$\overline{\text{WE}}$  provides the write control for the RTC memory locations.

### V<sub>CC</sub> Input supply voltage

+5V input

# bq4845/bq4845Y

## Address Map

The bq4845 provides 16 bytes of clock and control status registers. Table 1 is a map of the bq4845 registers, and Table 2 describes the register bits.

## Clock Memory Interface

The bq4845 has the same interface for clock/calendar and control information as standard SRAM. To read and write to these locations, the user must put the bq4845 in the proper mode and meet the timing requirements.

## Read Mode

The bq4845 is in read mode whenever  $\overline{OE}$  (Output enable) is low and  $\overline{CS}$  (chip select) is low. The unique address, specified by the 4 address inputs, defines which one of the 16 clock/calendar bytes is to be accessed. The bq4845 makes valid data available at the data I/O pins within  $t_{AA}$  (address access time). This occurs after the last address input signal is stable, and providing the  $\overline{CS}$  and  $\overline{OE}$  (output enable) access times are met. If the  $\overline{CS}$  and  $\overline{OE}$  access times are not met, valid data is available after the latter of chip select access time ( $t_{ACS}$ ) or output enable access time ( $t_{OE}$ ).

$\overline{CS}$  and  $\overline{OE}$  control the state of the eight three-state data I/O signals. If the outputs are activated before  $t_{AA}$ ,

**Table 1. bq4845 Clock and Control Register Map**

Ad- dress (h)	D7	D6	D5	D4	D3	D2	D1	D0	12-Hour Range (h)	Register	
0	0	10-second digit			1-second digit				00–59	Seconds	
1	ALM1	ALM0				1-second digit				00–59	Seconds alarm
		10-second digit									
2	0	10-minute digit			1-minute digit				00–59	Minutes	
3	ALM1	ALM0				1-minute digit				00–59	Minutes alarm
		10-minute digit									
4	PM/AM	0	10-hour digit			1-hour digit				01–12 AM/ 81– 92 PM	Hours
5	ALM1	ALM0	10-hour digit			1-hour digit				01–12 AM/ 81–92 PM	Hours alarm
	PM/AM										
6	0	0	10-day digit			1-day digit				01–31	Day
7	ALM1	ALM0	10-day digit			1-day digit				01–31	Day alarm
8	0	0			0	Day-of-week digit				01–07	Day-of-week
9	0	0	0	10 mo.	1-month digit				01–12	Month	
A	10-year digit				1-year digit				00–99	Year	
B	*	WD2	WD1	WD0	RS3	RS2	RS1	RS0		Programmable rates	
C	*	*			AIE	PIE	PWRIE	ABE		Interrupt enables	
D	*	*			AF	PF	PWRF	BVF		Flags	
E	*	*			UTI	$\overline{STOP}$	24/12	DSE		Control	
F	*	*	*	*	*	*	*	*		Unused	

**Notes:** \* = Unused bits; unwritable and read as 0.  
 0 = should be set to 0 for valid time/calendar range.  
 Clock calendar data in BCD. Automatic leap year adjustment.  
 PM/AM = 1 for PM; PM/AM = 0 for AM.  
 DSE = 1 enables daylight savings adjustment.  
 24/12 = 1 enables 24-hour data representation; 24/12 = 0 enables 12-hour data representation.  
 Day-of-Week coded as Sunday = 1 through Saturday = 7.  
 BVF = 1 for valid battery.  
 $\overline{STOP}$  = 1 turns the RTC on;  $\overline{STOP}$  = 0 stops the RTC in back-up mode.

Table 2. Clock and Control Register Bits

Bits	Description
24/12	24- or 12-hour representation
ABE	Alarm interrupt enable in battery-backup mode
AF	Alarm interrupt flag
AIE	Alarm interrupt enable
ALM0–ALM1	Alarm mask bits
BVF	Battery-valid flag
DSE	Daylight savings time enable
PF	Periodic interrupt flag
PIE	Periodic interrupt enable
PM/AM	PM or AM indication
PWRF	Power-fail interrupt flag
PWRIE	Power-fail interrupt enable
RS0–RS3	Periodic interrupt rate
$\overline{\text{STOP}}$	Oscillator stop and start
UTI	Update transfer inhibit
WD0 - WD2	Watchdog time-out rate

the data lines are driven to an indeterminate state until  $t_{AA}$ . If the address inputs are changed while  $\overline{\text{CS}}$  and  $\overline{\text{OE}}$  remain low, output data remains valid for  $t_{OH}$  (output data hold time), but goes indeterminate until the next address access.

### Write Mode

The bq4845 is in write mode whenever  $\overline{\text{WE}}$  and  $\overline{\text{CS}}$  are active. The start of a write is referenced from the latter-occurring falling edge of  $\overline{\text{WE}}$  or  $\overline{\text{CS}}$ . A write is terminated by the earlier rising edge of  $\overline{\text{WE}}$  or  $\overline{\text{CS}}$ . The addresses must be held valid throughout the cycle.  $\overline{\text{CS}}$  or  $\overline{\text{WE}}$  must return high for a minimum of  $t_{WR2}$  from  $\overline{\text{CS}}$  or  $t_{WR1}$  from  $\overline{\text{WE}}$  prior to the initiation of another read or write cycle.

Data-in must be valid  $t_{DW}$  prior to the end of write and remain valid for  $t_{DH1}$  or  $t_{DH2}$  afterward.  $\overline{\text{OE}}$  should be kept high during write cycles to avoid bus contention; although, if the output bus has been activated by a low on  $\overline{\text{CS}}$  and  $\overline{\text{OE}}$ , a low on  $\overline{\text{WE}}$  disables the outputs  $t_{WZ}$  after  $\overline{\text{WE}}$  falls.

### Reading the Clock

Once every second, the user-accessible clock/calendar locations are updated simultaneously from the internal real time counters. To prevent reading data in transition, updates to the bq4845 clock registers should be halted. Updating is halted by setting the update transfer inhibit (UTI) bit D3 of the control register E. As long as the UTI bit is 1, updates to user-accessible clock locations are inhibited. Once the frozen clock information is retrieved by reading the appropriate clock memory locations, the UTI bit should be reset to 0 in order to allow updates to occur from the internal counters. Because the internal counters are not halted by setting the UTI bit, reading the clock locations has no effect on clock accuracy. Once the UTI bit is reset to 0, the internal registers update within one second the user-accessible registers with the correct time. A halt command issued during a clock update allows the update to occur before freezing the data.

### Setting the Clock

The UTI bit must also be used to set the bq4845 clock. Once set, the locations can be written with the desired information in BCD format. Resetting the UTI bit to 0 causes the written values to be transferred to the internal clock counters and allows updates to the user-accessible registers to resume within one second.

### Stopping and Starting the Clock Oscillator

The bq4845 clock can be programmed to turn off when the part goes into battery back-up mode by setting  $\overline{\text{STOP}}$  to 0 prior to power down. If the board using the bq4845 is to spend a significant period of time in storage, the  $\overline{\text{STOP}}$  bit can be used to preserve some battery capacity.  $\overline{\text{STOP}}$  set to 1 keeps the clock running when  $V_{CC}$  drops below  $V_{SO}$ . With  $V_{CC}$  greater than  $V_{SO}$ , the bq4845 clock runs regardless of the state of  $\overline{\text{STOP}}$ .

### Power-Down/Power-Up Cycle

The bq4845 continuously monitors  $V_{CC}$  for out-of-tolerance. During a power failure, when  $V_{CC}$  falls below  $V_{PFD}$ , the bq4845 write-protects the clock and storage registers. When  $V_{CC}$  is below  $V_{BC}$  (3V typical), the power source is switched to BC. RTC operation and storage data are sustained by a valid backup energy source. When  $V_{CC}$  is above  $V_{BC}$ , the power source is  $V_{CC}$ . Write-protection continues for  $t_{CSR}$  time after  $V_{CC}$  rises above  $V_{PFD}$ .

An external CMOS static RAM is battery-backed using the  $V_{OUT}$  and chip enable output pins from the bq4845. As the voltage input  $V_{CC}$  slews down during a power failure, the chip enable output,  $\overline{\text{CE}}_{OUT}$ , is forced inactive independent of the chip enable input  $\overline{\text{CE}}_{IN}$ .

## bq4845/bq4845Y

This activity unconditionally write-protects the external SRAM as  $V_{CC}$  falls below  $V_{PFD}$ . If a memory access is in progress to the external SRAM during power-fail detection, that memory cycle continues to completion before the memory is write-protected. If the memory cycle is not terminated within time  $t_{WPT}$ , the chip enable output is unconditionally driven high, write-protecting the controlled SRAM.

As the supply continues to fall past  $V_{PFD}$ , an internal switching device forces  $V_{OUT}$  to the external backup energy source.  $\overline{CE}_{OUT}$  is held high by the  $V_{OUT}$  energy source.

During power-up,  $V_{OUT}$  is switched back to the 5V supply as  $V_{CC}$  rises above the backup cell input voltage sourcing  $V_{OUT}$ .  $\overline{CE}_{OUT}$  is held inactive for time  $t_{CER}$  after the power supply has reached  $V_{PFD}$ , independent of the  $\overline{CE}_{IN}$  input, to allow for processor stabilization.

During power-valid operation, the  $\overline{CE}_{IN}$  input is passed through to the  $\overline{CE}_{OUT}$  output with a propagation delay of less than 12ns.

Figure 2 shows the hardware hookup for the external RAM, battery, and crystal.

A primary backup energy source input is provided on the bq4845. The BC input accepts a 3V primary battery, typically some type of lithium chemistry. Since the bq4845 provides for reverse battery charging protection, no diode or current limiting resistor is needed in series with the cell. To prevent battery drain when there is no valid data to retain,  $V_{OUT}$  and  $\overline{CE}_{OUT}$  are internally isolated from BC by the initial connection of a battery. Following the first application of  $V_{CC}$  above  $V_{PFD}$ , this isolation is broken, and the backup cell provides power to  $V_{OUT}$  and  $\overline{CE}_{OUT}$  for the external SRAM.

The crystal should be located as close to X1 and X2 as possible and meet the specifications in the Crystal Specification Table. With the specified crystal, the bq4845 RTC will be accurate to within one minute per month at room temperature. In the absence of a crystal, a 32.768 kHz waveform can be fed into X1 with X2 grounded.

### Power-On Reset

The bq4845 provides a power-on reset, which pulls the RST pin low on power-down and remains low on power-up for  $t_{RST}$  after  $V_{CC}$  passes  $V_{PFD}$ . With valid battery voltage on BC, RST remains valid for  $V_{CC} = V_{SS}$ .

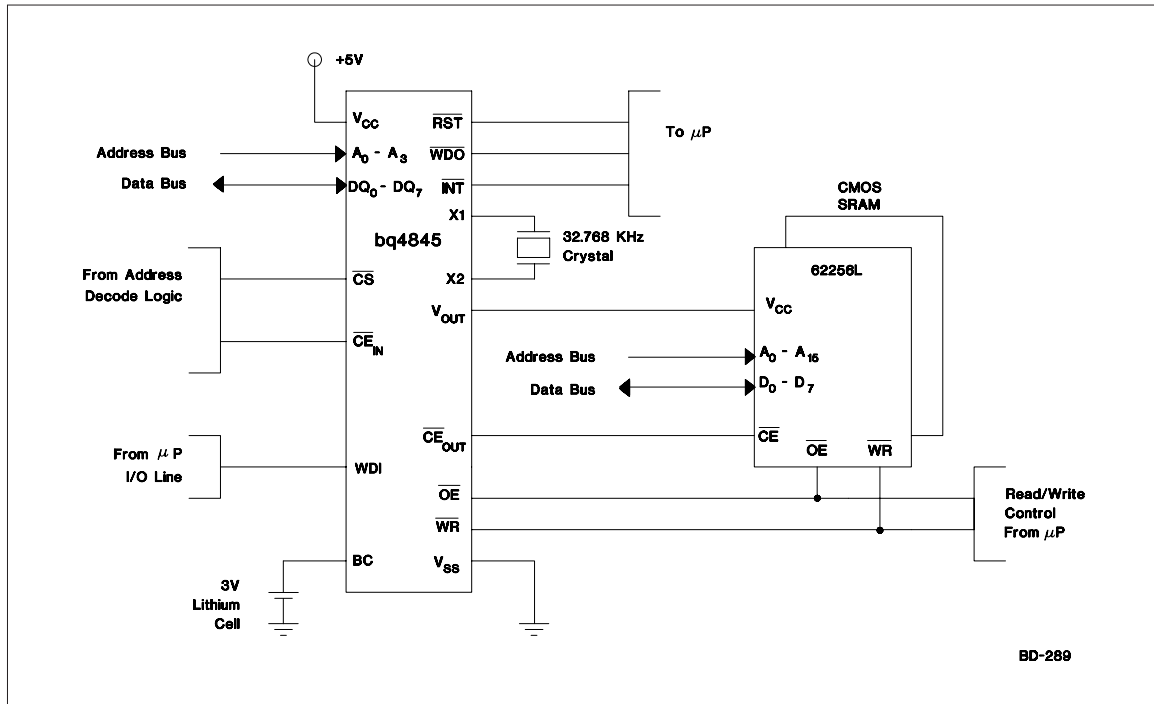

Figure 2. bq4845 Application Circuit

## Watchdog Timer

The watchdog monitors microprocessor activity through the Watchdog input (WDI). To use the watchdog function, connect WDI to a bus line or a microprocessor I/O line. If WDI remains high or low for longer than the watchdog time-out period (1.5 seconds default), the bq4845 asserts  $\overline{WDO}$  and  $\overline{RST}$ .

### Watchdog Input

The bq4845 resets the watchdog timer if a change of state (high to low, low to high, or a minimum 100ns pulse) occurs at the Watchdog input (WDI) during the watchdog period. The watchdog time-out is set by WD0-WD2 in register B. The bq4845 maintains the watchdog time-out programming through power cycles. The default state (no valid battery power) of WD0-WD2 is 000 or 1.5s on power-up. Table 3 shows the programmable watchdog time-out rates. The watchdog time-out period immediately after a reset is equal to the programmed watchdog time-out.

To disable the watchdog function, leave WDI floating. An internal resistor network (100k $\Omega$  equivalent impedance

at WDI) biases WDI to approximately 1.6V. Internal comparators detect this level and disable the watchdog timer. When  $V_{CC}$  is below the power-fail threshold, the bq4845 disables the watchdog function and disconnects WDI from its internal resistor network, thus making it high impedance.

### Watchdog Output

The Watchdog output ( $\overline{WDO}$ ) remains high if there is a transition or pulse at WDI during the watchdog time-out period. The bq4845 disables the watchdog function and  $\overline{WDO}$  is a logic high when  $V_{CC}$  is below the power fail threshold, battery-backup mode is enabled, or WDI is an open circuit. In watchdog mode, if no transition occurs at WDI during the watchdog time-out period, the bq4845 asserts  $\overline{RST}$  for the reset time-out period  $t_1$ .  $\overline{WDO}$  goes low and remains low until the next transition at WDI. If WDI is held high or low indefinitely,  $\overline{RST}$  will generate pulses ( $t_1$  seconds wide) every  $t_3$  seconds. Figure 3 shows the watchdog timing.

Figure 3. Watchdog Time-out Period and Reset Active Time

# bq4845/bq4845Y

## Interrupts

The bq4845 allows three individually selected interrupt events to generate an interrupt request on the INT pin. These three interrupt events are:

- The periodic interrupt, programmable to occur once every 30.5µs to 500ms
- The alarm interrupt, programmable to occur once per second to once per month
- The power-fail interrupt, which can be enabled to be asserted when the bq4845 detects a power failure

The periodic, alarm, and power-fail interrupts are enabled by an individual interrupt-enable bit in register C, the interrupts register. When an event occurs, its event flag bit in the flags register, register D, is set. If the corresponding event enable bit is also set, then an interrupt request is generated. Reading the flags register clears all flag bits and makes INT high impedance. To reset the flag register, the bq4845 addresses must be held stable at register D for at least 50ns to avoid inadvertent resets.

### Periodic Interrupt

Bits RS3–RS0 in the interrupts register program the rate for the periodic interrupt. The user can interpret the interrupt in two ways: either by polling the flags register for PF assertion or by setting PIE so that INT goes active when the bq4845 sets the periodic flag. Reading the flags register resets the PF bit and returns INT to the high-impedance state. Table 4 shows the periodic rates.

### Alarm Interrupt

Registers 1, 3, 5, and 7 program the real-time clock alarm. During each update cycle, the bq4845 compares the date, hours, minutes, and seconds in the clock regis-

ters with the corresponding alarm registers. If a match between all the corresponding bytes is found, the alarm flag AF in the flags register is set. If the alarm interrupt is enabled with AIE, an interrupt request is generated on INT. The alarm condition is cleared by a read to the flags register. ALM1 – ALM0 in the alarm registers, mask each alarm compare byte. An alarm byte is masked by setting ALM1 (D7) and ALM0 (D6) to 1. Alarm byte masking can be used to select the frequency of the alarm interrupt, according to Table 5.

The alarm interrupt can be made active while the bq4845 is in the battery-backup mode by setting ABE in the interrupts register. Normally, the INT pin goes high-impedance during battery backup. With ABE set, however, INT is driven low if an alarm condition occurs and the AIE bit is set. Because the AIE bit is reset during power-on reset, an alarm generated during power-on reset updates only the flags register. The user can read the flags register during boot-up to determine if an alarm was generated during power-on reset.

### Power-Fail Interrupt

When VCC falls to the power-fail-detect point, the power-fail flag PWRP is set. If the power-fail interrupt enable bit (PWRIE) is also set, then INT is asserted low. The power-fail interrupt occurs twpr before the bq4845 generates a reset and deselected. The PWRIE bit is cleared on power-up.

### Battery-Low Warning

The bq4845 checks the battery on power-up. When the battery voltage is approximately 2.1V, the battery-valid flag BVF in the flags register is set to a 0 indicating that clock and RAM data may be invalid.

**Table 3. Watchdog Time-out Rates**

WD2	WD1	WD0	Normal Watchdog Time-out Period (t <sub>2</sub> , t <sub>3</sub> )	Reset Time-out Period (t <sub>1</sub> )

## Capacitance ( $T_A = 25^\circ\text{C}$ , $F = 1\text{MHz}$ , $V_{CC} = 5.0\text{V}$ )

Symbol	Parameter	Minimum	Typical	Maximum	Unit	Conditions
$C_{I/O}$	Input/output capacitance	-	-	7	pF	Output voltage = 0V
$C_{IN}$	Input capacitance	-	-	5	pF	Input voltage = 0V

**Note:** These parameters are sampled and not 100% tested.

## AC Test Conditions

Parameter	Test Conditions
Input pulse levels	0V to 3.0V
Input rise and fall times	5 ns
Input and output timing reference levels	1.5 V (unless otherwise specified)
Output load (including scope and jig)	See Figures 4 and 5

Figure 4. Output Load A

Figure 5. Output Load B

**Read Cycle** ( $T_A = T_{OPR}, V_{CCmin} \leq V_{CC} \leq V_{CCmax}$ )

Symbol	Parameter	Min.	Max.	Unit	Conditions
t <sub>RC</sub>	Read cycle time	70	-	ns	
t <sub>AA</sub>	Address access time	-	70	ns	Output load A
t <sub>ACS</sub>	Chip select access time	-	70	ns	Output load A
t <sub>OE</sub>	Output enable to output valid	-	35	ns	Output load A
t <sub>CLZ</sub>	Chip select to output in low Z	5	-	ns	Output load B
t <sub>OLZ</sub>	Output enable to output in low Z	0	-	ns	Output load B
t <sub>CHZ</sub>	Chip deselect to output in high Z	0	25	ns	Output load B
t <sub>OHZ</sub>	Output disable to output in high Z	0	25	ns	Output load B
t <sub>OH</sub>	Output hold from address change	10	-	ns	Output load A

**Write Cycle** ( $T_A = T_{OPR}, V_{CCmin} \leq V_{CC} \leq V_{CCmax}$ )

Symbol	Parameter	Min.	Max.	Unit	Conditions
t <sub>WC</sub>	Write cycle time	70	-	ns	
t <sub>CW</sub>	Chip select to end of write	65	-	ns	(1)
t <sub>AW</sub>	Address valid to end of write	65	-	ns	(1)
t <sub>AS</sub>	Address setup time	0	-	ns	Measured from address valid to beginning of write. (2)
t <sub>WP</sub>	Write pulse width	55	-	ns	Measured from beginning of write to end of write. (1)
t <sub>WR1</sub>	Write recovery time (write cycle 1)	5	-	ns	Measured from $\overline{WE}$ going high to end of write cycle. (3)
t <sub>WR2</sub>	Write recovery time (write cycle 2)	15	-	ns	Measured from $\overline{CS}$ going high to end of write cycle. (3)
t <sub>DW</sub>	Data valid to end of write	30	-	ns	Measured to first low-to-high transition of either $\overline{CS}$ or $\overline{WE}$ .
t <sub>DH1</sub>	Data hold time (write cycle 1)	0	-	ns	Measured from $\overline{WE}$ going high to end of write cycle. (4)
t <sub>DH2</sub>	Data hold time (write cycle 2)	10	-	ns	Measured from $\overline{CS}$ going high to end of write cycle. (4)
t <sub>WZ</sub>	Write enabled to output in high Z	0	25	ns	I/O pins are in output state. (5)
t <sub>OW</sub>	Output active from end of write	0	-	ns	I/O pins are in output state. (5)

- Notes:**
1. A write ends at the earlier transition of  $\overline{CS}$  going high and  $\overline{WE}$  going high.
  2. A write occurs during the overlap of a low  $\overline{CS}$  and a low  $\overline{WE}$ . A write begins at the later transition of  $\overline{CS}$  going low and  $\overline{WE}$  going low.
  3. Either t<sub>WR1</sub> or t<sub>WR2</sub> must be met.
  4. Either t<sub>DH1</sub> or t<sub>DH2</sub> must be met.
  5. If  $\overline{CS}$  goes low simultaneously with  $\overline{WE}$  going low or after  $\overline{WE}$  going low, the outputs remain in high-impedance state.

# bq4845/bq4845Y

## Read Cycle No. 1 (Address Access) <sup>1,2</sup>

RC-1

## Read Cycle No. 2 (CS Access) <sup>1,3,4</sup>

RC-38

## Read Cycle No. 3 (OE Access) <sup>1,5</sup>

RC-3

- Notes:**
1.  $\overline{WE}$  is held high for a read cycle.
  2. Device is continuously selected:  $\overline{CS} = \overline{OE} = V_{IL}$ .
  3. Address is valid prior to or coincident with  $\overline{CS}$  transition low.
  4.  $\overline{OE} = V_{IL}$ .
  5. Device is continuously selected:  $\overline{CS} = V_{IL}$ .

Aug. 1995

**Write Cycle No. 1 (WE-Controlled)** <sup>1,2,3</sup>

WC-12

**Write Cycle No. 2 (CS-Controlled)** <sup>1,2,3,4,5</sup>

WC-13

- Notes:**
1.  $\overline{CS}$  or  $\overline{WE}$  must be high during address transition.
  2. Because I/O may be active ( $\overline{OE}$  low) during this period, data input signals of opposite polarity to the outputs must not be applied.
  3. If  $\overline{OE}$  is high, the I/O pins remain in a state of high impedance.
  4. Either  $t_{WR1}$  or  $t_{WR2}$  must be met.
  5. Either  $t_{DH1}$  or  $t_{DH2}$  must be met.

## Power-Down/Power-Up Timing (TA = TOPR)

Symbol	Parameter	Minimum	Typical	Maximum	Unit	Conditions
t <sub>F</sub>	V <sub>CC</sub> slew from 4.75 to 4.25V	300	-	-	μs	
t <sub>FS</sub>	V <sub>CC</sub> slew from 4.25 to V <sub>SO</sub>	10	-	-	μs	
t <sub>R</sub>	V <sub>CC</sub> slew from V <sub>SO</sub> to V <sub>PFD(MAX)</sub>	100	-	-	μs	
t <sub>PF</sub>	Interrupt delay from V <sub>PFD</sub>	6	-	24	μs	
t <sub>WPT</sub>	Write-protect time for external RAM	90	100	125	μs	Delay after V <sub>CC</sub> slews down past V <sub>PFD</sub> before SRAM is write-protected and RST activated.
t <sub>CSR</sub>	$\overline{\text{CS}}$ at V <sub>IH</sub> after power-up	100	200	300	ms	Internal write-protection period after V <sub>CC</sub> passes V <sub>PFD</sub> on power-up.
t <sub>RST</sub>	V <sub>PFD</sub> to $\overline{\text{RST}}$ inactive	t <sub>CSR</sub>	-	t <sub>CSR</sub>	ms	Reset active time-out period
t <sub>CER</sub>	Chip enable recovery time	t <sub>CSR</sub>	-	t <sub>CSR</sub>	ms	Time during which external SRAM is write-protected after V <sub>CC</sub> passes V <sub>PFD</sub> on power-up.
t <sub>CED</sub>	Chip enable propagation delay to external SRAM	-	9	12	ns	Output load A

**Caution:** Negative undershoots below the absolute maximum rating of -0.3V in battery-backup mode may affect data integrity.

## Power-Down/Power-Up Timing

**Notes:** PWRIE set to "1" to enable power fail interrupt.  
RST and INT are open drain and require an external pull-up resistor.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
