DM3730, DM3725
Digital Media Processors

Check for Samples: DM3730, DM3725

1 DM3730, DM3725 Digital Media Processors

1.1 Features

- DM3730/25 Digital Media Processors:
  - Compatible with OMAP™ 3 Architecture
  - ARM® Microprocessor (MPU) Subsystem
    - Up to 1-GHz ARM® Cortex™-A8 Core Also supports 300, 600, and 800-MHz operation
    - NEON™ SIMD Coprocessor
  - High Performance Image, Video, Audio (IVA2.2™) Accelerator Subsystem
    - Up to 800-MHz TMS320C64x+™ DSP Core Also supports 260, 520, and 660-MHz operation
    - Enhanced Direct Memory Access (EDMA) Controller (128 Independent Channels)
    - Video Hardware Accelerators
  - POWERVR SGX™ Graphics Accelerator (DM3730 only)
    - Tile Based Architecture Delivering up to 20 MPoly/sec
    - Universal Scalable Shader Engine: Multi-threaded Engine Incorporating Pixel and Vertex Shader Functionality
    - Industry Standard API Support: OpenGLES 1.1 and 2.0, OpenVG1.0
    - Fine Grained Task Switching, Load Balancing, and Power Management
    - Programmable High Quality Image Anti-Aliasing
  - Advanced Very-Long-Instruction-Word (VLIW) TMS320C64x+™ DSP Core
    - Eight Highly Independent Functional Units
    - Six ALUs (32-/40-Bit); Each Supports Single 32- bit, Dual 16-bit, or Quad 8-bit, Arithmetic per Clock Cycle
    - Two Multipliers Support Four 16 x 16-Bit Multiplies (32-Bit Results) per Clock Cycle or Eight 8 x 8-Bit Multiplies (16-Bit Results) per Clock Cycle
    - Load-Store Architecture With Non-Aligned Support
    - 64 32-Bit General-Purpose Registers
    - Instruction Packing Reduces Code Size
    - All Instructions Conditional
    - Additional C64x+™ Enhancements
      - Protected Mode Operation
      - Expectations Support for Error Detection and Program Redirection
      - Hardware Support for Modulo Loop Operation
  - C64x+™ L1/L2 Memory Architecture
    - 32K-Byte L1P Program RAM/Cache (Direct Mapped)
    - 80K-Byte L1D Data RAM/Cache (2-Way Set- Associative)
    - 64K-Byte L2 Unified Mapped RAM/Cache (4- Way Set-Associative)
    - 32K-Byte L2 Shared SRAM and 16K-Byte L2 ROM
  - C64x+™ Instruction Set Features
    - Byte-Addressable (8-/16-/32-/64-Bit Data)
    - 8-Bit Overflow Protection
    - Bit-Field Extract, Set, Clear
    - Normalization, Saturation, Bit-Counting
    - Compact 16-Bit Instructions
    - Additional Instructions to Support Complex Multiplies
  - External Memory Interfaces:
    - SDRAM Controller (SDRC)
      - 16, 32-bit Memory Controller With 1G-Byte Total Address Space
      - Interfaces to Low-Power SDRAM
      - SDRAM Memory Scheduler (SMS) and Rotation Engine
    - General Purpose Memory Controller (GPMC)
      - 16-bit Wide Multiplexed Address/Data

Bus
  - Up to 8 Chip Select Pins With 128M-Byte Address Space per Chip Select Pin
  - Glueless Interface to NOR Flash, NAND Flash (With ECC Hamming Code Calculation), SRAM and Pseudo-SRAM
  - Flexible Asynchronous Protocol Control for Interface to Custom Logic (FPGA, CPLD, ASICs, etc.)
  - Nonmultiplexed Address/Data Mode (Limited 2K-Byte Address Space)
- 1.8-V I/O and 3.0-V (MMC1 only), 0.9-V to 1.2-V Adaptive Processor Core Voltage
  0.9-V to 1.1-V Adaptive Core Logic Voltage
  Note: These are default Operating Performance Point (OPP) voltages and could be optimized to lower values using SmartReflex AVS.
- Commercial, Industrial, and Extended Temperature Grades
- Serial Communication
  - 5 Multichannel Buffered Serial Ports (McBSPs)
    - 512 Byte Transmit/Receive Buffer (McBSP1/3/4/5)
    - 5K-Byte Transmit/Receive Buffer (McBSP2)
    - SIDETONE Core Support (McBSP2 and 3 Only) For Filter, Gain, and Mix Operations
    - Direct Interface to I2S and PCM Device and T Buses
    - 128 Channel Transmit/Receive Mode
  - Four Master/Slave Multichannel Serial Port Interface (McSPI) Ports
  - High-Speed/Full-Speed/Low-Speed USB OTG Subsystem (12-/8-Pin ULPI Interface)
  - High-Speed/Full-Speed/Low-Speed Multiport USB Host Subsystem
    - 12-/8-Pin ULPI Interface or 6-/4-/3-Pin Serial Interface
  - One HDQ/1-Wire Interface
  - Four UARTs (One with Infrared Data Association [IrDA] and Consumer Infrared [CIR] Modes)
  - Three Master/Slave High-Speed Inter-Integrated Circuit (I2C) Controllers
- Camera Image Signal Processing (ISP)
  - CCD and CMOS Imager Interface
  - Memory Data Input
  - BT.601/BT.656 Digital YCbCr 4:2:2 (8-/10-Bit) Interface
  - Glueless Interface to Common Video Decoders
  - Resize Engine
    - Resize Images From 1/4x to 4x
    - Separate Horizontal/Vertical Control
- System Direct Memory Access (SDMA) Controller (32 Logical Channels With Configurable Priority)
- Comprehensive Power, Reset, and Clock Management
  - SmartReflex™ Technology
  - Dynamic Voltage and Frequency Scaling (DVFS)
- ARM® Cortex™-A8 Core
  - ARMv7 Architecture
    - TrustZone®
    - Thumb®-2
    - MMU Enhancements
  - In-Order, Dual-Issue, Superscalar Microprocessor Core
  - NEON Multimedia Architecture
  - Over 2x Performance of ARMv6 SIMD
  - Supports Both Integer and Floating Point SIMD
  - Jazelle® RCT Execution Environment Architecture
  - Dynamic Branch Prediction with Branch Target Address Cache, Global History Buffer, and 8-Entry Return Stack
  - Embedded Trace Macrocell (ETM) Support for Non-Invasive Debug
- ARM Cortex-A8 Memory Architecture:
  - 32K-Byte Instruction Cache (4-Way Set-Associative)
  - 32K-Byte Data Cache (4-Way Set-Associative)
  - 256K-Byte L2 Cache
- 32K-Byte ROM
- 64K-Byte Shared SRAM
- Endianess:
  - ARM Instructions - Little Endian
  - ARM Data – Configurable
  - DSP Instructions/Data - Little Endian
- Removable Media Interfaces:
  - Three Multimedia Card (MMC)/ Secure Digital (SD) With Secure Data I/O (SDIO)
- Test Interfaces
  - IEEE-1149.1 (JTAG) Boundary-Scan Compatible
  - Embedded Trace Macro Interface (ETM)
  - Serial Data Transport Interface (SDTI)
- 12 32-bit General Purpose Timers
- 2 32-bit Watchdog Timers

- **1 32-bit Secure Watchdog Timer**
- **1 32-bit 32-kHz Sync Timer**
- **Up to 188 General-Purpose I/O (GPIO) Pins (Multiplexed With Other Device Functions)**
- **45-nm CMOS Technology**
- **Package-On-Package (POP) Implementation for Memory Stacking (Not Available in CUS Package)**
- **Packages:**
  - **515-pin s-PBGA package (CBP Suffix), .5mm Ball Pitch (Top), .4mm Ball Pitch (Bottom)**
  - **515-pin s-PBGA package (CBC Suffix), .65mm Ball Pitch (Top), .5mm Ball Pitch (Bottom)**
  - **423-pin s-PBGA package (CUS Suffix), .65mm Ball Pitch**

1.2 Description

The DM37x generation of high-performance, digital media processors are based on the enhanced device architecture and are integrated on TI's advanced 45-nm process technology. This architecture is designed to provide best in class ARM and Graphics performance while delivering low power consumption. This balance of performance and power allow the device to support the following example applications:

- Portable Data Terminals
- Navigation
- Auto Infotainment
- Gaming
- Medical Imaging
- Home Automation
- Human Interface
- Industrial Control
- Test and Measurement
- Single board Computers

The device can support numerous HLOS and RTOS solutions including Linux and Windows Embedded CE which are available directly from TI. Additionally, the device is fully backward compatible with previous Cortex™-A8 processors and OMAP™ processors.

This DM3730/25 Digital Media Processor data manual presents the electrical and mechanical specifications for the DM3730/25 Digital Media Processor. The information contained in this data manual applies to the commercial, industrial, and extended temperature versions of the DM3730/25 Digital Media Processor unless otherwise indicated. It consists of the following sections:

- A description of the DM3730/25 terminals: assignment, electrical characteristics, multiplexing, and functional description
- A presentation of the electrical characteristics requirements: power domains, operating conditions, power consumption, and dc characteristics
- The clock specifications: input and output clocks, DPLL and DLL
- A description of thermal characteristics, device nomenclature, and mechanical data about the available packaging

1.3 Functional Block Diagram

The functional block diagram of the DM3730/25 Digital Media Processor is shown below.

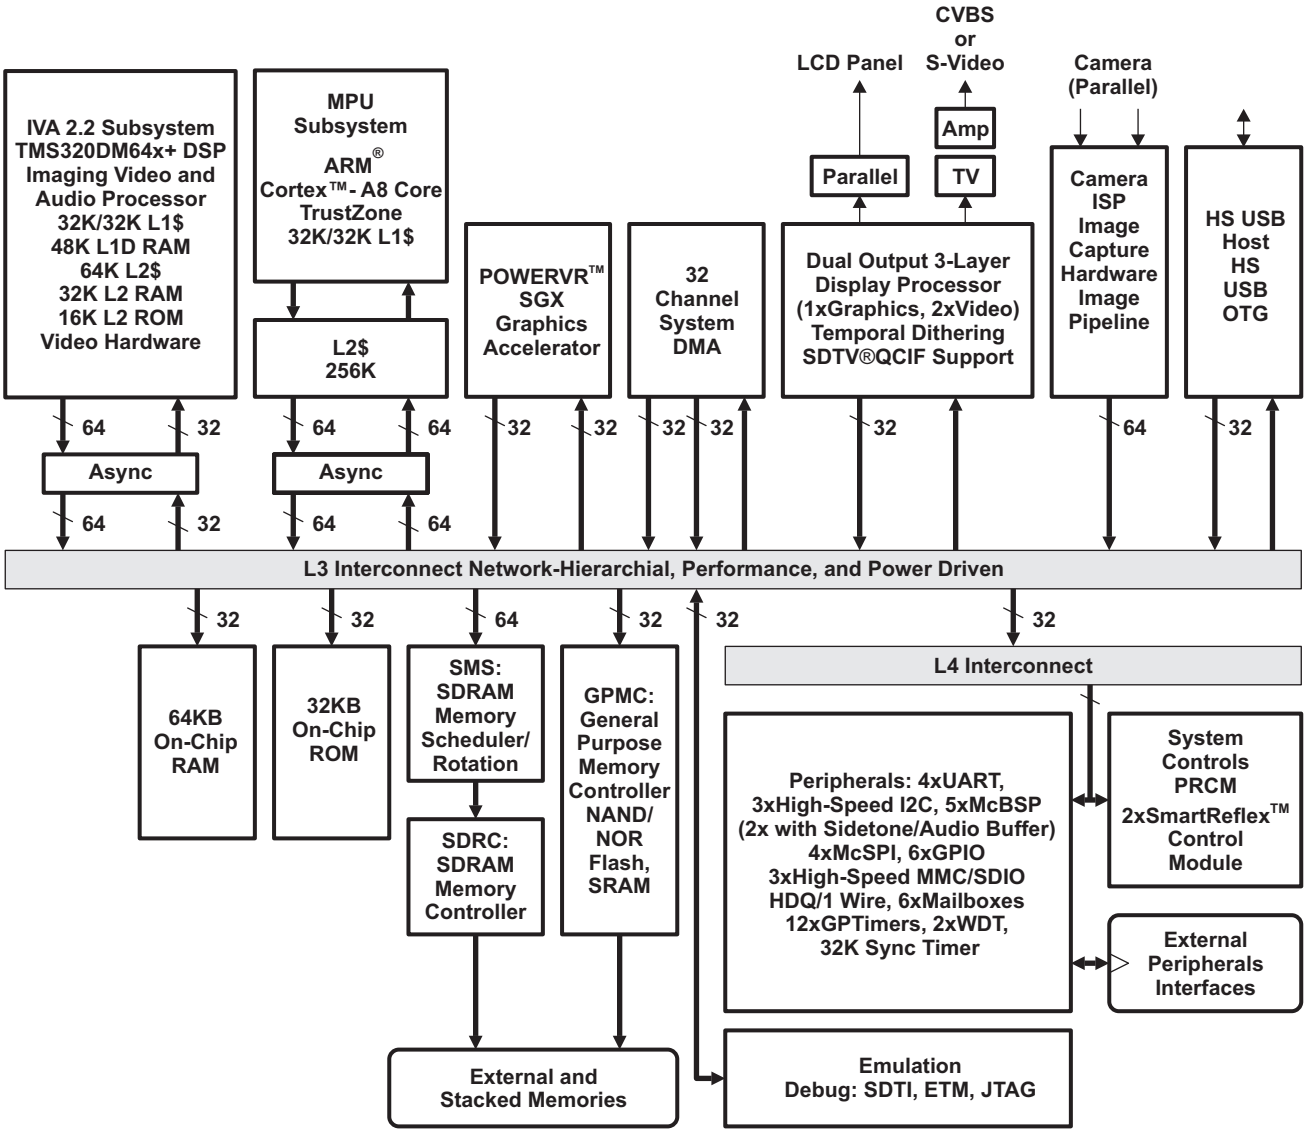

Figure 1-1. DM3730/25 Functional Block Diagram

Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

This data sheet revision history highlights the technical changes made from the previous to the current revision.

Revision History

SECTION	ADDITIONS/CHANGES/DELETIONS
Terminal Description	Changed: • Table 2-1. Ball Characteristics (CBP Pkg.). Removed restriction note from GPIO_16. • Table 2-2. Ball Characteristics (CBC Pkg.). Removed restriction note from GPIO_16. • Table 2-3. Ball Characteristics (CUS Pkg.). Removed restriction note from GPIO_16.
Electrical Characteristics	Changed: • Table 3-1. Absolute Maximum Rating over Junction Temperature Range. Added JTAG to VESD. • Table 3-5. DC Electrical Characteristics. Removed USIM ball R27.
Clock Specifications	Added note on rise and fall times for these tables: • Input Clock Requirements • sys_xtalin Squarer Input Clock Timing Requirements - Bypass Mode • sys_32k Input Clock Timing Requirements • sys_altclk Input Clock Timing Requirements • sys_clkout1 Output Clock Switching Characteristics • sys_clkout2 Output Clock Switching Characteristics Added: • Table 4-2, Crystal Electrical Characteristics. Added entry for DL - Crystal drive level

2 TERMINAL DESCRIPTION

2.1 Terminal Assignment

Figure 2-1 through Figure 2-5 show the ball locations for the 515- and 423- ball plastic ball grid array (s-PBGA) packages. Table 2-1 through Table 2-25 indicate the signal names and ball grid numbers for both packages.

Note: There are no balls present on the top of the 423-ball s-PBGA package.

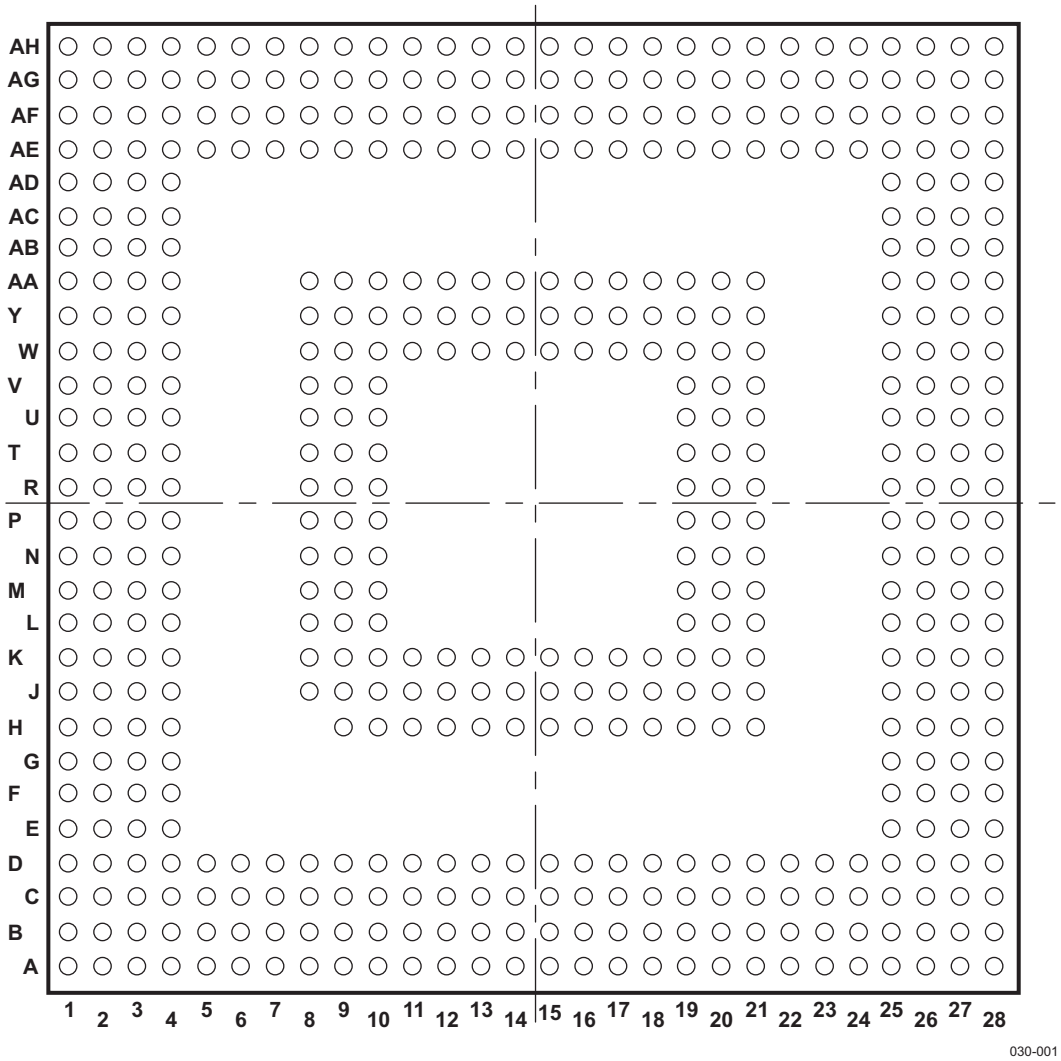

Figure 2-1. DM3730/25 Digital Media Processor CBP s-PBGA-N515 Package (Bottom View)

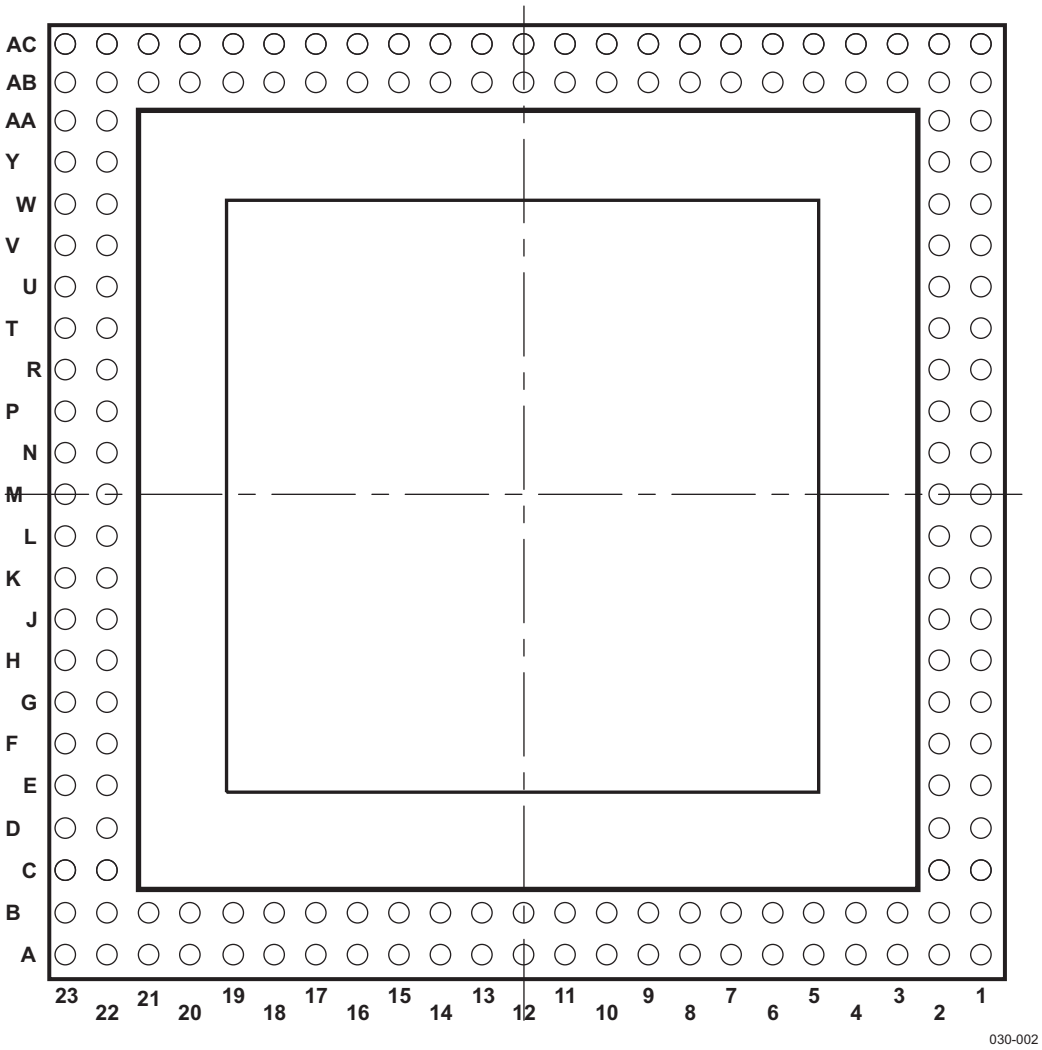

Figure 2-2. DM3730/25 Digital Media Processor CBP s-PBGA-N515 Package (Top View)

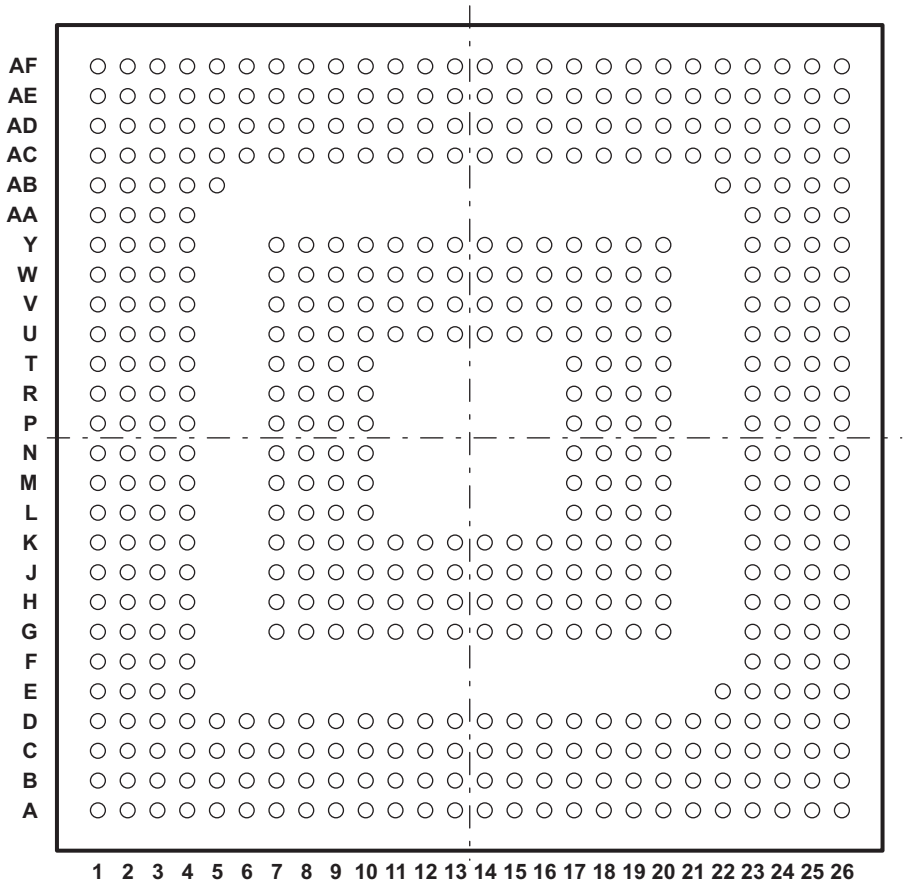

Figure 2-3. DM3730/25 Digital Media Processor CBC s-PBGA-515 Package (Bottom View)

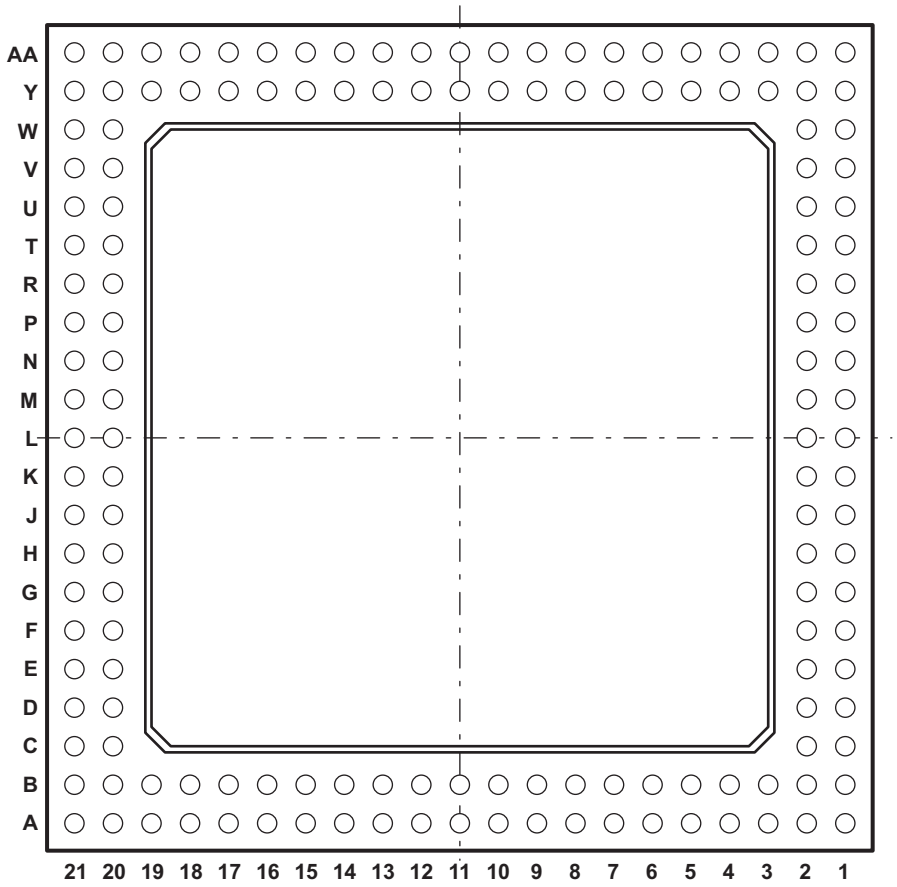

Figure 2-4. DM3730/25 Digital Media Processor CBC s-PBGA-515 Package (Top View)

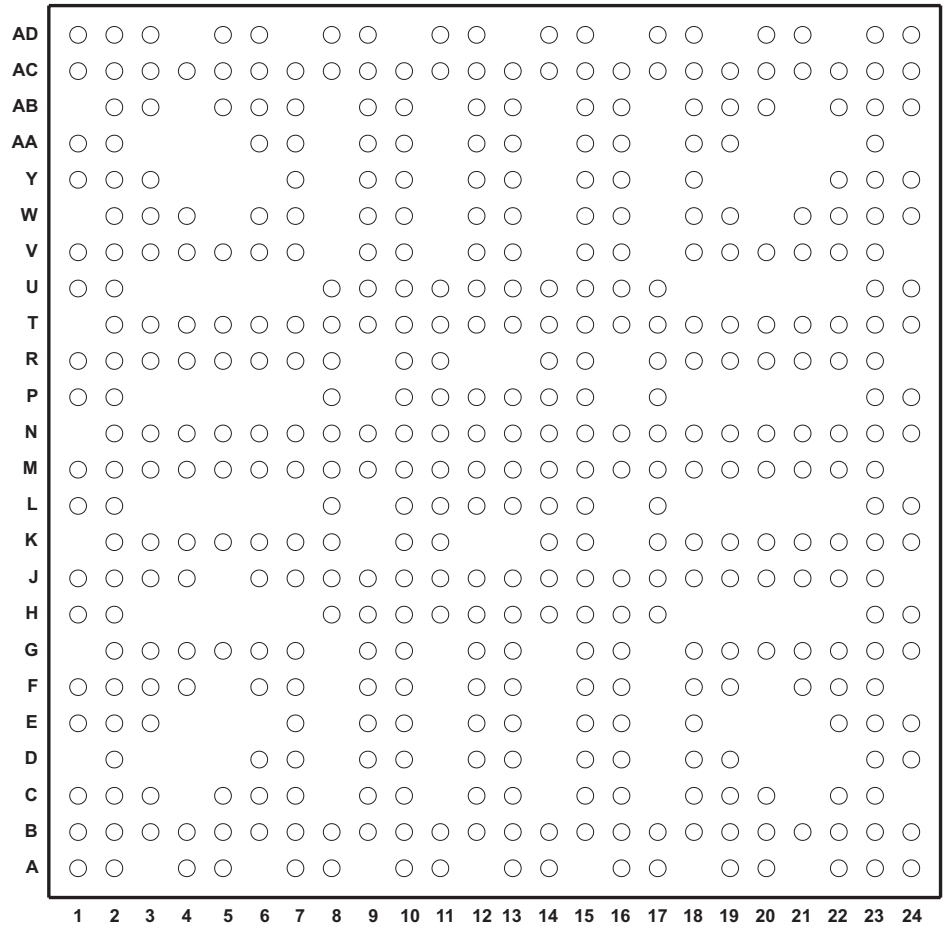

Figure 2-5. DM3730/25 Digital Media Processor CUS s-PBGA-N423 Package (Bottom View)

2.2 Pin Assignments

2.2.1 Pin Map (Top View)

The following pin maps show the top views of the 515-pin sPBGA package **[CBP]**, the 515-pin sPBGA package **[CBC]**, and the 423-pin sPBGA package **[CUS]** pin assignments in four quadrants (A, B, C, and D).

Note: A pin with an "NC" designator indicates No Connection. For proper device operation, these pins must be left unconnected.

Figure 2-17. CUS Pin Map [Quadrant D - Top View]

2.3 Ball Characteristics

Table 2-1 through Table 2-3 describe the terminal characteristics and the signals multiplexed on each pin for the CBP, CBC, and CUS packages, respectively. The following list describes the table column headers.

1. **BALL BOTTOM:** Ball number(s) on the bottom side associated with each signal(s) on the bottom.
2. **PIN NAME:** Names of signals multiplexed on each ball (also notice that the name of the pin is the signal name in mode 0).
   Note: Table 2-3 does not take into account subsystem pin multiplexing options. Subsystem pin multiplexing options are described in Section 2.5, *Signal Descriptions.*
3. **MODE:** Multiplexing mode number.
   (a) Mode 0 is the primary mode; this means that when mode 0 is set, the function mapped on the pin corresponds to the name of the pin. There is always a function mapped on the primary mode. Notice that primary mode is not necessarily the default mode.

   Note: The default mode is the mode at the release of the reset; also see the RESET REL. MODE column.
   (b) Modes 1 to 7 are possible modes for alternate functions. On each pin, some modes are effectively used for alternate functions, while some modes are not used and do not correspond to a functional configuration.
4. **TYPE:** Signal direction
   - I = Input
   - O = Output
   - I/O = Input/Output
   - D = Open drain
   - DS = Differential
   - A = Analog
   - PWR = Power
   - GND = Ground

   Note: In the safe_mode, the buffer is configured in high-impedance.
5. **BALL RESET STATE:** The state of the terminal at the power-on reset.
   - 0: The buffer drives V_{OL} (pulldown/pullup resistor not activated)
     0(PD): The buffer drives V_{OL} with an active pulldown resistor.
   - 1: The buffer drives V_{OH} (pulldown/pullup resistor not activated)
     1(PU): The buffer drives V_{OH} with an active pullup resistor.
   - Z: High-impedance
   - L: High-impedance with an active pulldown resistor
   - H : High-impedance with an active pullup resistor
6. **BALL RESET REL. STATE:** The state of the terminal at the release of the System Control Module reset (PRCM CORE_RSTPWRON_RET reset signal).
   - 0: The buffer drives V_{OL} (pulldown/pullup resistor not activated)
     0(PD): The buffer drives V_{OL} with an active pulldown resistor.
   - 1: The buffer drives V_{OH} (pulldown/pullup resistor not activated)
     1(PU): The buffer drives V_{OH} with an active pullup resistor.
   - Z: High-impedance
   - L: High-impedance with an active pulldown resistor
   - H : High-impedance with an active pullup resistor
7. **RESET REL. MODE:** The mode is automatically configured at the release of the System Control Module reset (PRCM CORE_RSTPWRON_RET reset signal).
8. **POWER:** The voltage supply that powers the terminal's I/O buffers.
9. **HYS:** Indicates if the input buffer is with hysteresis.
10. **BUFFER STRENGTH:** Drive strength of the associated output buffer.

11. **PULL U/D - TYPE:** Denotes the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
Note: The pullup/pulldown drive strength is equal to minimum = 50µA, typical = 100 µA, maximum = 250 µA (unless otherwise specified), except for CBP balls P27, P26, R27, and R25, and CUS balls N22 and P24, where the pulldown drive strength is equal to 1.8 kΩ.
12. **IO CELL:** IO cell information.

Note: Configuring two pins to the same input signal is not supported as it can yield unexpected results. This can be easily prevented with the proper software configuration.

NOTE

In the DM3730/25 device, new Far End load Settings registers are added for some IOs. This new feature configures the IO according to the transmission line and the application/peripheral load. For a full description on these registers, see the System Control Module / SCM Functional Description / Functional Register Description / Signal Integrity Parameter Control Registers with Pad Group Assignment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

G1, A13, A14,A16, A17, B14, B16, B17, C14, C15, C17, D17, D18, H9, H10, H11, H12, H13, H14, H15, H16, H17, A4, A6, A7, A9, A10, A11, A19, A20, A21, B3, B4, B6, B7, B9, B10, B11, B13, B19, B20, B21, C1,C2, C3, C4,C5, C6, C8,C9, C11, C12, C18, C20, C21, D1, D2, D3, D4, D5,D6, D11, D12,D14, D20, E1,E2, AA26, AE27	AB2, AB22, B2, B22	No Connect(2)	-	-								
Y17	NA	sys_xtalgnd	0	GND								
U4	NA	cap_vdd_bb_ mpu_iva	0	PWR								
V4	NA	cap_vdd_sram _mpu_iva	0	PWR								
L21	NA	cap_vdd_sram_core	0	PWR								

(1) The usage of this GPIO is strongly restricted. For more information, see the GPIO chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(2) Pins labeled as "No connect" must be left unconnected. Any connections to these pins may result in unpredictable behavior.

(3) NA in this table stands for "Not Applicable".

(4) The drive strength is fixed regardless of the load. The driver is designed to drive 75-ohm for video applications.

(5) PU = [50 to 100 kΩ] per default or [10 to 50 kΩ] according to the selected mode.
For a full description of the pull-up drive strength programming, see the PRG_SDMMC_PUSTRENGTH configuration register bit field in the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).
PD: 30 to 150 kΩ.

(6) The pullup and pulldown can be either the standard LVCMOS 100-µA drive strength or the I2C pullup and pulldown described below: Nominal resistance = 1.66 kΩ in high-speed mode with a load range of 5 pF to 12 pF, 4.5 kΩ in standard / fast mode with a load range of 5 pF to 15 pF.

(7) The default buffer configuration is High-Speed I2C point-to-point mode using internal pullup. For a full description of the pull drive strength programming, see prg_i2c1_pullupresx, prg_i2c1_lb1lb0, and prg_sr_pullupresx, prg_sr_lb bits of the CONTROL_PROG_IO1, CONTROL_PROG_IO_WKUP1 control modules in the System Control Module / SCM Programming Model / Feature Settings section and the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4) to modify the IO settings if required by the targeted interface application.

(8) The default buffer configuration is standard LVCMOS mode (non-I2C). For a full description of the pull drive strength programming, see PADCONFS bits of CONTROL_PADCONF_X control modules (standard LVCMOS mode), or prg_i2c2_pullupresx, prg_i2c2_lb1lb0, and prg_i2c3_pullupresx, prg_i2c3_lb1lb0 bits of the CONTROL_PROG_IO2, CONTROL_PROG_IO3 control modules (I2C mode) in the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4) to modify the IO settings if required by the targeted interface application.

(9) These signals are feed-through balls. For more information, see Table 2-28.

(10) In buffer mode, the drive strength is fixed regardless of the load. The driver is designed to drive 75Ω for video applications. In bypass mode, the drive strength is 0.47 mA.

(11) Depending on the sys_clkreq direction the corresponding reset released state value can be:
- Z if sys_clkreq is used as input
- 1 if sys_clkreq is used as output

For a full description of the sys_clkreq control, see Power, Reset, and Clock Management chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(12) The drive strength of these IOs is set according to the programmable load range: 2 pF to 4 pF per default or 4 pF to 12 pF. For a full description of the drive strength programming, see the System Control Module chapter of the *AM/DM37x Multimedia Device Technical*

Reference Manual (literature number SPRUGN4).

(13) In the safe_mode_out1, the buffer is configured to drive 1.

(14) Mux0 if sys_boot6 is pulled down (clock master).

(15) If MMC1 functional signals are enabled, vdds_mmc1 for MMC1 must be supplied by a dedicated power source.
If MMC1 functional signals are disabled, other multiplexed CMOS signals of the interface can be enabled. The interface can be supplied by the same power source as vdds. The vdds power source supplies the vdds_mmc1 ball.
If neither MMC1 functional balls or CMOS signals are enabled, the interface balls are left unconnected with its associated power supply (vdda/vssa) grounded.
For the corresponding setting of the PBIASLITEPWRDNZ0 bit, see the System Control Module / SCM Programming Model / Extended-Drain I/Os and PBIAS Cells Programming Guide section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(1) The drive strength of these IOs is set according to the programmable load range: 2 pF to 4 pF per default or 4 pF to 12 pF. For a full description of the drive strength programming, see the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(2) Pins labeled as "No connect" must be left unconnected. Any connections to these pins may result in unpredictable behavior.

(3) PU = [50 to 100 kΩ] per default or [10 to 50 kΩ] according to the selected mode.
For a full description of the pull-up drive strength programming, see the PRG_SDMMC_PUSTRENGTH configuration register bit field in the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).
PD: 30 to 150 kΩ.

(4) These signals are feed-through balls. For more information, see Table 2-27.

(5) NA in this table stands for "Not Applicable".

(6) In the safe_mode_out1, the buffer is configured to drive 1.

(7) Depending on the sys_clkreq direction the corresponding reset released state value can be:
- Z if sys_clkreq is used as input
- 1 if sys_clkreq is used as output

For a full description of the sys_clkreq control, see Power, Reset, and Clock Management chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(8) The usage of this GPIO is strongly restricted. For more information, see the General-Purpose Interface chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(9) The pullup and pulldown can be either the standard LVCMOS 100-µA drive strength or the I2C pullup and pulldown described as follows: Nominal resistance = 1.66 kΩ in high-speed mode with a load range of 5 pF to 12 pF, 4.5 kΩ in standard / fast mode with a load range of 5 pF to 15 pF.

(10) The default buffer configuration is High-Speed I2C point-to-point mode using internal pullup. For a full description of the pull drive strength programming, see prg_i2c1_pullupresx, prg_i2c1_lb1lb0, and prg_sr_pullupresx, prg_sr_lb bits of the CONTROL_PROG_IO1, CONTROL_PROG_IO_WKUP1 control modules in the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4) to modify the IO settings if required by the targeted interface application.

(11) The default buffer configuration is standard LVCMOS mode (non-I2C). For a full description of the pull drive strength programming, see PADCONFS bits of CONTROL_PADCONF_X control modules (standard LVCMOS mode), or prg_i2c2_pullupresx, prg_i2c2_lb1lb0, and prg_i2c3_pullupresx, prg_i2c3_lb1lb0 bits of the CONTROL_PROG_IO2, CONTROL_PROG_IO3 control modules (I2C mode) in the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4) to modify the IO settings if required by the targeted interface application.

(12) Mux0 if sys_boot6 is pulled down (clock master).

(13) If MMC1 functional signals are enabled, vdds_mmc1 for MMC1 must be supplied by a dedicated power source.
If MMC1 functional signals are disabled, other multiplexed CMOS signals of the interface can be enabled. The interface can be supplied by the same power source as vdds. The vdds power source supplies the vdds_mmc1 ball.
If neither MMC1 functional balls or CMOS signals are enabled, the interface balls are left unconnected with its associated power supply (vdda/vssa) grounded.
For the corresponding setting of the PBIASLITEPWRDNZ0 bit, see the System Control Module / SCM Programming Model / Extended-Drain I/Os and PBIAS Cells Programming Guide section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

W15	sys_xtalgnd	0	GND	-	-	-	-	-	-	-	-

(1) NA in this table stands for "Not Applicable".

(2) Pins labeled as "No connect" must be left unconnected. Any connections to these pins may result in unpredictable behavior.

(3) Depending on the sys_clkreq direction the corresponding reset released state value can be:
- Z if sys_clkreq is used as input
- 1 if sys_clkreq is used as output

For a full description of the sys_clkreq control, see Power, Reset, and Clock Management chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(4) PU = [50 to 100 kΩ] per default or [10 to 50 kΩ] according to the selected mode. For a full description of the pull-up drive strength programming, see the PRG_SDMMC_PUSTRENGTH configuration register bit field in the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4). PD: 30 to 150 kΩ.

(5) The usage of this GPIO is strongly restricted. For more information, see the General-Purpose Interface chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(6) The drive strength is fixed regardless of the load. The driver is designed to drive 75Ω for video applications.

(7) In buffer mode, the drive strength is fixed regardless of the load. The driver is designed to drive 75Ω for video applications. In bypass mode, the drive strength is 0.47 mA.

(8) The drive strength of these IOs is set according to the programmable load range: 2 pF to 4 pF per default or 4 pF to 12 pF. For a full description of the drive strength programming, see the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(9) In the safe_mode_out1, the buffer is configured to drive 1.

(10) The pullup and pulldown can be either the standard LVCMOS 100-µA drive strength or the I2C pullup and pulldown described below: Nominal resistance = 1.66 kΩ in high-speed mode with a load range of 5 pF to 12 pF, 4.5 kΩ in standard / fast mode with a load range of 5 pF to 15 pF.

(11) The default buffer configuration is High-Speed I2C point-to-point mode using internal pullup. For a full description of the pull drive strength programming, see prg_i2c1_pullupresx, prg_i2c1_lb1lb0, and prg_sr_pullupresx, prg_sr_lb bits of the CONTROL_PROG_IO1, CONTROL_PROG_IO_WKUP1 control modules in the System Control Module / SCM Programming Model / Feature Settings section and the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4) to modify the IO settings if required by the targeted interface application.

(12) The default buffer configuration is standard LVCMOS mode (non-I2C). For a full description of the pull drive strength programming, see PADCONFS bits of CONTROL_PADCONF_X control modules (standard LVCMOS mode), or prg_i2c2_pullupresx, prg_i2c2_lb1lb0, and prg_i2c3_pullupresx, prg_i2c3_lb1lb0 bits of the CONTROL_PROG_IO2, CONTROL_PROG_IO3 control modules (I2C mode) in the System Control Module chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4) to modify the IO settings if required by the targeted interface application.

(13) Mux0 if sys_boot6 is pulled down (clock master).

(14) If MMC1 functional signals are enabled, vdds_mmc1 for MMC1 must be supplied by a dedicated power source.
If MMC1 functional signals are disabled, other multiplexed CMOS signals of the interface can be enabled. The interface can be supplied by the same power source as vdds. The vdds power source supplies the vdds_mmc1 ball.
If neither MMC1 functional balls or CMOS signals are enabled, the interface balls are left unconnected with its associated power supply (vdda/vssa) grounded.
For the corresponding setting of the PBIASLITEPWRDNZ0 bit, see the System Control Module / SCM Programming Model / Extended-Drain I/Os and PBIAS Cells Programming Guide section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

2.4 Multiplexing Characteristics

Table 2-4 provides a description of the multiplexing on the CBP, CBC, and CUS packages, respectively.

Note: The following does not take into account subsystem pin multiplexing options. Subsystem pin multiplexing options are described in Section 2.5, *Signal Description.* For more information, see the System Control Module / System Control Module Functional Description / Pad Functional Multiplexing and Configuration section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(1) This GPIO is only an input (and not an output).

(2) The usage of this GPIO is strongly restricted. For more information, see the General-Purpose Interface chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(3) UART4 is only available on CBP and CBC packages.

2.5 Signal Description

Many signals are available on multiple pins according to the software configuration of the pin multiplexing options.

1. **SIGNAL NAME:** The signal name
2. **DESCRIPTION:** Description of the signal
3. **TYPE:** Type = Ball type for this specific function:
   - I = Input
   - O = Output
   - Z = High-impedance
   - D = Open Drain
   - DS = Differential
   - A = Analog
4. **BALL BOTTOM:** Associated ball(s) bottom
5. **BALL TOP:** Associated ball(s) top
6. **SUBSYSTEM PIN MULTIPLEXING:** Contains a list of the pin multiplexing options at the module/subsystem level. The pin function is selected at the module/system level.

   Note: The Subsystem Multiplexing Signals are not described in the following tables. For more information, see the System Control Module / System Control Module Functional Description / Pad Functional Multiplexing and Configuration section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

2.5.1 External Memory Interfaces

NOTE

For more information, see Memory Subsystem / General-Purpose Memory Controller / GPMC Environment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

2.5.2 Video Interfaces

Table 2-7. Video Interfaces – CAM Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
cam_hs	Camera Horizontal Synchronization	IO	A24	C23	A22
cam_vs	Camera Vertical Synchronization	IO	A23	D23	E18
cam_xclka	Camera Clock Output a	O	C25	C25	B22
cam_xclkb	Camera Clock Output b	O	B26	E25	C22
cam_d0	Camera digital image data bit 0	I	AG17	AE16	AB18
cam_d1	Camera digital image data bit 1	I	AH17	AE15	AC18
cam_d2	Camera digital image data bit 2	I	B24	A24	G19
cam_d3	Camera digital image data bit 3	I	C24	B24	F19
cam_d4	Camera digital image data bit 4	I	D24	D24	G20
cam_d5	Camera digital image data bit 5	I	A25	C24	B21
cam_d6	Camera digital image data bit 6	I	K28	P25	L24
cam_d7	Camera digital image data bit 7	I	L28	P26	K24
cam_d8	Camera digital image data bit 8	I	K27	N25	J23
cam_d9	Camera digital image data bit 9	I	L27	N26	K23
cam_d10	Camera digital image data bit 10	I	B25	D25	F21
cam_d11	Camera digital image data bit 11	I	C26	E26	G21
cam_fld	Camera field identification	IO	C23	B23	H24
cam_pclk	Camera pixel clock	I	C27	C26	J19
cam_wen	Camera Write Enable	I	B23	A23	F18
cam_strobe	Flash strobe control signal	O	D25	D26	J20
cam_global_reset	Global reset is used strobe synchronization	IO	C23 / AH3 / AA21	B23/M3/V17	H24/ AA2/ AB20
cam_shutter	Mechanical shutter control signal	O	B23 / AF3 / T21	A23 / T19/ L3	F18/ Y2/ AA18

NOTE

For more information, see Display Subsystem / Display Subsystem Environment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 2-8. Video Interfaces – DSS Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
dss_pclk	LCD Pixel Clock	O	D28	G25	G22
dss_hsync	LCD Horizontal Synchronization	O	D26	K24	E22
dss_vsync	LCD Vertical Synchronization	O	D27	M25	F22
dss_acbias	AC bias control (STN) or pixel data enable (TFT) output	O	E27	F26	J21
dss_data0	LCD Pixel Data bit 0	O	AG22 / H26	AE21 / M24	AC19 / G24
dss_data1	LCD Pixel Data bit 1	O	AH22 / H25	AE22 / M26	AB19 / H23
dss_data2	LCD Pixel Data bit 2	O	AG23 / E28	AE23 / F25	AD20 / D23
dss_data3	LCD Pixel Data bit 3	O	AH23 / J26	AE24 / N24	AC20 / K22
dss_data4	LCD Pixel Data bit 4	O	AG24 / AC27	AD23 / AC25	AD21 / V21
dss_data5	LCD Pixel Data bit 5	O	AH24 / AC28	AD24 / AB25	AC21 / W21
dss_data6	LCD Pixel Data bit 6	O	E26	G26	D24
dss_data7	LCD Pixel Data bit 7	O	F28	H25	E23
dss_data8	LCD Pixel Data bit 8	O	F27	H26	E24
dss_data9	LCD Pixel Data bit 9	O	G26	J26	F23
dss_data10	LCD Pixel Data bit 10	O	AD28	AC26	AC22

Table 2-8. Video Interfaces – DSS Signals Description (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
dss_data11	LCD Pixel Data bit 11	O	AD27	AD26	AC23
dss_data12	LCD Pixel Data bit 12	O	AB28	AA25	AB22
dss_data13	LCD Pixel Data bit 13	O	AB27	Y25	Y22
dss_data14	LCD Pixel Data bit 14	O	AA28	AA26	W22
dss_data15	LCD Pixel Data bit 15	O	AA27	AB26	V22
dss_data16	LCD Pixel Data bit 16	O	G25	L25	J22
dss_data17	LCD Pixel Data bit 17	O	H27	L26	G23
dss_data18	LCD Pixel Data bit 18	O	H26 / AH26	M24 / F3	G24 / AB12
dss_data19	LCD Pixel Data bit 19	O	H25 / AG26	M26 / D3	H23 / AC16
dss_data20	LCD Pixel Data bit 20	O	E28 / AF18	F25 / E3	D23 / AD18
dss_data21	LCD Pixel Data bit 21	O	J26 / AF19	N24 / E4	K22 / AC17
dss_data22	LCD Pixel Data bit 22	O	AC27 / AE21	AC25 / G23	V21 / AB16
dss_data23	LCD Pixel Data bit 23	O	AC28 / AF21	AB25 / D4	W21 / AA15

Table 2-9. Video Interfaces – RFBI Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]	SUBSYSTEM PIN MULTIPLEXING [6]
rfbi_a0	RFBI command/data control	O	E27	F26	J21	dss_acbias
rfbi_cs0	1st LCD chip select	O	D26	K24	E22	dss_hsync
rfbi_da0	RFBI data bus 0	IO	AG22 / H26	AE21 / M24	AC19 / G24	dss_data0
rfbi_da1	RFBI data bus 1	IO	AH22 / H25	AE22 / M26	AB19 / H23	dss_data1
rfbi_da2	RFBI data bus 2	IO	AG23 / E28	AE23 / F25	AD20 / D23	dss_data2
rfbi_da3	RFBI data bus 3	IO	AH23 / J26	AE24 / N24	AC20 / K22	dss_data3
rfbi_da4	RFBI data bus 4	IO	AG24 / AC27	AD23 / AC25	AD21 / V21	dss_data4
rfbi_da5	RFBI data bus 5	IO	AH24 / AC28	AD24 / AB25	AC21 / W21	dss_data5
rfbi_da6	RFBI data bus 6	IO	E26	G26	D24	dss_data6
rfbi_da7	RFBI data bus 7	IO	F28	H25	E23	dss_data7
rfbi_da8	RFBI data bus 8	IO	F27	H26	E24	dss_data8
rfbi_da9	RFBI data bus 9	IO	G26	J26	F23	dss_data9
rfbi_da10	RFBI data bus 10	IO	AD28	AC26	AC22	dss_data10
rfbi_da11	RFBI data bus 11	IO	AD27	AD26	AC23	dss_data11
rfbi_da12	RFBI data bus 12	IO	AB28	AA25	AB22	dss_data12
rfbi_da13	RFBI data bus 13	IO	AB27	Y25	Y22	dss_data13
rfbi_da14	RFBI data bus 14	IO	AA28	AA26	W22	dss_data14
rfbi_da15	RFBI data bus 15	IO	AA27	AB26	V22	dss_data15
rfbi_rd	Read enable for RFBI	O	D28	G25	G22	dss_pclk
rfbi_wr	Write Enable for RFBI	O	D27	M25	F22	dss_vsync
rfbi_te_vsync 0	tearing effect removal and Vsync input from 1st LCD	I	G25	L25	J22	dss_data16
rfbi_hsync0	Hsync for 1st LCD	I	H27	L26	G23	dss_data17
rfbi_te_vsync 1	tearing effect removal and Vsync input from 2nd LCD	I	H26 / AH26	M24 / F3	G24 / AB12	dss_data18
rfbi_hsync1	Hsync for 2nd LCD	I	H25 / AG26	M26 / D3	H23 / AC16	dss_data19
rfbi_cs1	2nd LCD chip select	O	E28 / AF18	F25 / E3	D23 / AD18	dss_data20

Table 2-10. Video Interfaces – TV Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
cvideo1_out	TV analog output Composite: cvideo1_out	AO	Y28	W26	AB24
cvideo2_out	TV analog output S-VIDEO: cvideo2_out	AO	W28	V26	AA23
cvideo1_vfb	cvideo1_vfb: Feedback through external resistor to composite	AO	Y27	W25	AB23
cvideo2_vfb	cvideo2_vfb: Feedback through external resistor to S-VIDEO	AO	W27	U24	Y23
cvideo1_rset	cvideo1 input reference current resistor setting	AIO	W26	V23	Y24

2.5.3 Serial Communication Interfaces

For more information, see HDQ/1-Wire / HDQ/1-Wire Environment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 2-11. Serial Communication Interfaces – HDQ/1-Wire Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
hdq_sio	Bidirectional HDQ 1-Wire control and data Interface. Output is open drain.	IOD	J25	J23	A24

For more information, see Multimaster High-Speed I2C Controller / HS I2C Environment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 2-12. Serial Communication Interfaces – I^2C Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
INTER-INTEGRATED CIRCUIT INTERFACE (I2C1)					
i2c1_scl	I^2C Master Serial clock. Output is open drain.	OD	K21	J25	K20
i2c1_sda	I^2C Serial Bidirectional Data. Output is open drain.	IOD	J21	J24	K21
INTER-INTEGRATED CIRCUIT INTERFACE (I2C3)					
i2c3_scl	I^2C Master Serial clock. Output is open drain.	OD	AF14	AB4	AC13
i2c3_sda	I^2C Serial Bidirectional Data. Output is open drain.	IOD	AG14	AC4	AC12
i2c3_sccbe	Serial Camera Control Bus Enable	OD	J25	J23	A24
INTER-INTEGRATED CIRCUIT INTERFACE (I2C2)					
i2c2_scl	I^2C Master Serial clock. Output is open drain.	OD	AF15	C2	AC15
i2c2_sda	I^2C Serial Bidirectional Data. Output is open drain.	IOD	AE15	C1	AC14
i2c2_sccbe	Serial Camera Control Bus Enable	OD	J25	J23	A24

For more information, see Power Reset and Clock Management / PRCM Introduction to Power Management / SmartReflex Voltage-Control Overview section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 2-13. Serial Communication Interfaces – SmartReflex Signals Description(1)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
INTER-INTEGRATED CIRCUIT INTERFACE (I2C4)					
i2c4_scl	I^2C Master Serial clock. Output is open drain.	OD	AD26	AD15	Y16
i2c4_sda	I^2C Serial Bidirectional Data. Output is open drain.	IOD	AE26	W16	Y15

(1) For more information on SmartReflex voltage control, see the PRCM chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

For more information, see Multi-Channel Buffered Serial Port / McBSP Environment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 2-14. Serial Communication Interfaces – McBSP LP Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
MULTICHANNEL SERIAL (McBSP LP 1)					

Table 2-14. Serial Communication Interfaces – McBSP LP Signals Description (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
mcbsp1_dr	Received serial data	I	U21	T20	Y18
mcbsp1_clkr	Receive Clock	IO	Y8 / Y21	U19 / H3	V7 / W19
mcbsp1_fsr	Receive frame synchronization	IO	AA21	V17	AB20
mcbsp1_dx	Transmitted serial data	O	V21	U17	W18
mcbsp1_clkx	Transmit clock	IO	W21	T17	V18
mcbsp1_fsx	Transmit frame synchronization	IO	K26	P20	AA19
mcbsp_clks	External clock input (shared by McBSP1, 2, 3, 4, and 5)	I	T21	T19	AA18
MULTICHANNEL SERIAL (McBSP LP 2)					
mcbsp2_dr	Received serial data	I	R21	T18	V19
mcbsp2_dx	Transmitted serial data	O	M21	R19	R20
mcbsp2_clkx	Combined serial clock	IO	N21	R18	T21
mcbsp2_fsx	Combined frame synchronization	IO	P21	U18	V20
MULTICHANNEL SERIAL (McBSP LP 3)					
mcbsp3_dr	Received serial data	I	AE6 / AB25 / U21	T20 / AA24 / N3	V5 / Y18
mcbsp3_dx	Transmitted serial data	O	AF6 / AB26 / V21	U17 / Y24 / P3	V6 / W18
mcbsp3_clkx	Combined serial clock	IO	AF5 / AA25 / W21	T17 / AD22 / U3	W4 / V18
mcbsp3_fsx	Combined frame synchronization	IO	AE5 / AD25 / K26	P20 / AD21 / W3	V4 / AA19
MULTICHANNEL SERIAL (McBSP LP 4)					
mcbsp4_dr	Received serial data	I	R8 / AD1	C4 / U4	G5
mcbsp4_dx	Transmitted serial data	O	P8 / AD2	B5 / R3	F3
mcbsp4_clkx	Combined serial clock	IO	T8 / AE1	B4 / V3	F4
mcbsp4_fsx	Combined frame synchronization	IO	N8 / AC1	C5 / T3	G4
MULTICHANNEL SERIAL (McBSP LP 5)					
mcbsp5_dr	Received serial data	I	AE11	Y3	AC5
mcbsp5_dx	Transmitted serial data	O	AF13	AE3	AC8
mcbsp5_clkx	Combined serial clock	IO	AF10	AB2	AC1
mcbsp5_fsx	Combined frame synchronization	IO	AH9	AB1	AD2

For more information, see Multichannel SPI / McSPI Environment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 2-15. Serial Communication Interfaces – McSPI Signals Description(1)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
MULTICHANNEL SERIAL PORT INTERFACE (McSPI1)					
mcspi1_clk	SPI Clock	IO	AB3	P9	T5
mcspi1_simo	Slave data in, master data out	IO	AB4	P8	R4
mcspi1_somi	Slave data out, master data in	IO	AA4	P7	T4
mcspi1_cs0	SPI Enable 0, polarity configured by software	IO	AC2	R7	T6
mcspi1_cs1	SPI Enable 1, polarity configured by software	O	AC3	R8	NA
mcspi1_cs2	SPI Enable 2, polarity configured by software	O	AB1	R9	NA
mcspi1_cs3	SPI Enable 3, polarity configured by software	O	AB2	T8	R5
MULTICHANNEL SERIAL PORT INTERFACE (McSPI2)					
mcspi2_clk	SPI Clock	IO	AA3	W7	N5
mcspi2_simo	Slave data in, master data out	IO	Y2	W8	N4
mcspi2_somi	Slave data out, master data in	IO	Y3	U8	N3
mcspi2_cs0	SPI Enable 0, polarity configured by software	IO	Y4	V8	M5

Table 2-15. Serial Communication Interfaces – McSPI Signals Description[1] (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
mcspi2_cs1	SPI Enable 1, polarity configured by software	O	V3	V9	M4
MULTICHANNEL SERIAL PORT INTERFACE (McSPI3)					
mcspi3_clk	SPI Clock	IO	H26 / AE2 / AE13	W10 / M24 / AA3	G24 / Y1 / AD8
mcspi3_simo	Slave data in, master data out	IO	H25 / AG5 / AF11	R10 / M26 / AC3	H23 / AB5 / AD6
mcspi3_somi	Slave data out, master data in	IO	E28 / AH5 / AG12	F25 / T10 / AD4	D23 / AB3 / AC6
mcspi3_cs0	SPI Enable 0, polarity configured by software	IO	J26 / AF4 / AH12	U9 / N24 / AD3	K22 / V3 / AC7
mcspi3_cs1	SPI Enable 1, polarity configured by software	O	AC27 / AG4 / AH14	AC25 / U10 / AD2	V21 / W3 / AD9
MULTICHANNEL SERIAL PORT INTERFACE (McSPI4)					
mcspi4_clk	SPI Clock	IO	Y8 / Y21	U19 / H3	V7 / W19
mcspi4_simo	Slave data in, master data out	IO	V21	U17	W18
mcspi4_somi	Slave data out, master data in	IO	U21	T20	Y18
mcspi4_cs0	SPI Enable 0, polarity configured by software	IO	K26	P20	AA19

(1) NA in this table stands for "Not applicable".

For more information, see UART/IrDA/CIR / UART/IrDA/CIR Environment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 2-16. Serial Communication Interfaces – UARTs Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
UNIVERSAL ASYNCHRONOUS RECEIVER/TRANSMITTER (UART1)					
uart1_cts	UART1 Clear To Send	I	AG22 / W8 / T21	AE21 / T19 / W2	AC19 / AC2 / AA18
uart1_rts	UART1 Request To Send	O	AH22 / AA9	AE22 / R2	W6 / AB19
uart1_rx	UART1 Receive data	I	F28 / Y8 / AE7	H3 / H25 / AE4	E23 / V7 / AC3
uart1_tx	UART1 Transmit data	O	E26 / AA8	L4 / G26	D24 / W7
UNIVERSAL ASYNCHRONOUS RECEIVER/TRANSMITTER (UART2)					
uart2_cts	UART2 Clear To Send	I	AF6 / AB26 / U26	Y24/ P3/ W20	V6/ U23
uart2_rts	UART2 Request To Send	O	AE6 / AB25 / U27	AA24/ N3/ V18	V5/ U24
uart2_rx	UART2 Receive data	I	AE5 / AD25/ U28	W3/ AD21/ Y20	T23/ V4
uart2_tx	UART2 Transmit data	O	AF5 / AA25/ T27	U3/AD22/V20	T24/ W4
UNIVERSAL ASYNCHRONOUS RECEIVER/TRANSMITTER (UART3) / IrDA					
uart3_cts_rctx	UART3 Clear To Send (input), Remote TX (output)	IO	H18 / U26	W20 / F23	A23 / U23
uart3_rts_sd	UART3 Request To Send, IR enable	O	H19 / U27	V18 / F24	B23 / U24
uart3_rx_irrx	UART3 Receive data, IR and Remote RX	I	AG24 / H20 / U28 / F27	AD23 / Y20 / H24/ H26	AD21 / B24 / T23 / E24
uart3_tx_irtx	UART3 Transmit data, IR TX	O	AH24 / H21 / T27/ G26	AD24 / V20 / J29 / G24	AC21 / C23 / T24/ F23
UNIVERSAL ASYNCHRONOUS RECEIVER/TRANSMITTER (UART4) / IrDA					
uart4_rx	UART4 Receive data	I	J8	C6	NA
uart4_tx	UART4 Transmit data	O	K8	B3	NA

For more information, see High-Speed USB Host Subsystem and High-Speed USB OTG Controller / High-Speed USB Host Subsystem / High-Speed USB Host Subsystem Environment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 2-17. Serial Communication Interfaces – USB Signals Description Section 4.3.6

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
HIGH-SPEED UNIVERSAL SERIAL BUS INTERFACE (HSUSB0)					

Table 2-17. Serial Communication Interfaces – USB Signals Description[Section 4.3.6] (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
hsusb0_clk	Dedicated for external transceiver 60-MHz clock input to PHY	I	T28	W19	R21
hsusb0_stp	Dedicated for external transceiver Stop signal	O	T25	U20	R23
hsusb0_dir	Dedicated for external transceiver Data direction control from PHY	I	R28	V19	P23
hsusb0_nxt	Dedicated for external transceiver Next signal from PHY	I	T26	W18	R22
hsusb0_data0	Dedicated for external transceiver Bidirectional data bus	IO	T27	V20	T24
hsusb0_data1	Dedicated for external transceiver Bidirectional data bus	IO	U28	Y20	T23
hsusb0_data2	Dedicated for external transceiver Bidirectional data bus	IO	U27	V18	U24
hsusb0_data3	Dedicated for external transceiver Bidirectional data bus	IO	U26	W20	U23
hsusb0_data4	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	U25	W17	W24
hsusb0_data5	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	V28	Y18	V23
hsusb0_data6	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	V27	Y19	W23
hsusb0_data7	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	V26	Y17	T22
MM_FSUSB3					
mm3_rxdm	Vminus receive data (not used in 3- or 4-pin configurations)	IO	AE3	K3	NA
mm3_rxdp	Vplus receive data (not used in 3- or 4-pin configurations)	IO	AH3	M3	NA
mm3_rxrcv	Differential receiver signal input (not used in 3-pin mode)	IO	AD1	U4	NA
mm3_txse0	Single-ended zero. Used as VM in 4-pin VP_VM mode.	IO	AE1	V3	NA
mm3_txdat	USB data. Used as VP in 4-pin VP_VM mode.	IO	AD2	R3	NA
mm3_txen_n	Transmit enable	IO	AC1	T3	NA
MM_FSUSB2					
mm2_rxdm	Vminus receive data (not used in 3- or 4-pin configurations)	IO	AH7	AF7	AD11
mm2_rxdp	Vplus receive data (not used in 3- or 4-pin configurations)	IO	AF7	AF6	AC9
mm2_rxrcv	Differential receiver signal input (not used in 3-pin mode)	IO	AG8	AF9	AC11
mm2_txse0	Single-ended zero. Used as VM in 4-pin VP_VM mode.	IO	AH8	AE9	AD12
mm2_txdat	USB data. Used as VP in 4-pin VP_VM mode.	IO	AB2	T8	R5
mm2_txen_n	Transmit enable	IO	V3	V9	M4
MM_FSUSB1					
mm1_rxdm	Vminus receive data (not used in 3- or 4-pin configurations)	IO	AG9	V2	AD5
mm1_rxdp	Vplus receive data (not used in 3- or 4-pin configurations)	IO	AF10	AB2	AC1
mm1_rxrcv	Differential receiver signal input (not used in 3-pin mode)	IO	AF11	AC3	AD6
mm1_txse0	Single-ended zero. Used as VM in 4-pin VP_VM mode.	IO	AG12	AD4	AC6
mm1_txdat	USB data. Used as VP in 4-pin VP_VM mode.	IO	AH12	AD3	AC7
mm1_txen_n	Transmit enable	IO	AH14	AD2	AD9
HSUSB2					
hsusb2_clk	Dedicated for external transceiver 60-MHz clock input to PHY	O	AE7	AE4	AC3
hsusb2_stp	Dedicated for external transceiver Stop signal	O	AF7	AF6	AC9
hsusb2_dir	Dedicated for external transceiver Data direction control from PHY	I	AG7	AE6	AC10
hsusb2_nxt	Dedicated for external transceiver Next signal from PHY	I	AH7	AF7	AD11
hsusb2_data0	Dedicated for external transceiver Bidirectional data bus	IO	AG8	AF9	AC11
hsusb2_data1	Dedicated for external transceiver Bidirectional data bus	IO	AH8	AE9	AD12
hsusb2_data2	Dedicated for external transceiver Bidirectional data bus	IO	AB2	T8	R5
hsusb2_data3	Dedicated for external transceiver Bidirectional data bus	IO	V3	V9	M4
hsusb2_data4	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	Y2	W8	N4
hsusb2_data5	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	Y3	U8	N3
hsusb2_data6	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	Y4	V8	M5

Table 2-17. Serial Communication Interfaces – USB Signals Description Section 4.3.6 (continued)

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
hsusb2_data7	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	AA3	W7	N5
HSUSB1					
hsusb1_clk	Dedicated for external transceiver 60-MHz clock input to PHY	O	AE10	AB3	AD3
hsusb1_stp	Dedicated for external transceiver Stop signal	O	AF10	AB2	AC1
hsusb1_dir	Dedicated for external transceiver data direction control from PHY	I	AF9	AA4	AC4
hsusb1_nxt	Dedicated for external transceiver Next signal from PHY	I	AG9	V2	AD5
hsusb1_data0	Dedicated for external transceiver Bidirectional data bus	IO	AF11	AC3	AD6
hsusb1_data1	Dedicated for external transceiver Bidirectional data bus	IO	AG12	AD4	AC6
hsusb1_data2	Dedicated for external transceiver Bidirectional data bus	IO	AH12	AD3	AC7
hsusb1_data3	Dedicated for external transceiver Bidirectional data bus	IO	AH14	AD2	AD9
hsusb1_data4	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	AE11	Y3	AC5
hsusb1_data5	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	AH9	AB1	AD2
hsusb1_data6	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	AF13	AE3	AC8
hsusb1_data7	Dedicated for external transceiver Bidirectional data bus additional signals for 12-pin ULPI operation	IO	AE13	AA3	AD8

- NA in this table stands for "Not applicable".
- This pin is not supported on the CUS package.

2.5.4 Removable Media Interfaces

For more information, see MMC/SDIO Card Interface / MMC/SDIO Environment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 2-18. Removable Media Interfaces – MMC/SDIO Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
MULTIMEDIA MEMORY CARD (MMC1) / SECURE DIGITAL IO (SDIO1)					
mmc1_clk	MMC/SD Output Clock	O	N28	N19	M23
mmc1_cmd	MMC/SD command signal	IO	M27	L18	L23
mmc1_dat0	MMC/SD Card Data bit 0 / SPI Serial Input	IO	N27	M19	M22
mmc1_dat1	MMC/SD Card Data bit 1	IO	N26	M18	M21
mmc1_dat2	MMC/SD Card Data bit 2	IO	N25	K18	M20
mmc1_dat3	MMC/SD Card Data bit 3	IO	P28	N20	N23
MULTIMEDIA MEMORY CARD (MMC2) / SECURE DIGITAL IO (SDIO2)					
mmc2_clk	MMC/SD Output Clock	O	AE2	W10	Y1
mmc2_dir_dat0	Direction control for DAT0 signal case an external transceiver used	O	AE4	V10	AB2
mmc2_dir_dat1	Direction control for DAT1 and DAT3 signals case an external transceiver used	O	AH3	M3	AA2
mmc2_dir_dat2	Direction control for DAT2 signal case an external transceiver used	O	AF19	E4	AC17
mmc2_dir_dat3	Direction control for DAT4, DAT5, DAT6, and DAT7 signals case an external transceiver used	O	AE21	G3	AB16
mmc2_clkin	MMC/SD input Clock	I	AE3	K3	AA1
mmc2_dat0	MMC/SD Card Data bit 0	IO	AH5	T10	AB3
mmc2_dat1	MMC/SD Card Data bit 1	IO	AH4	T9	Y3
mmc2_dat2	MMC/SD Card Data bit 2	IO	AG4	U10	W3
mmc2_dat3	MMC/SD Card Data bit 3	IO	AF4	U9	V3
mmc2_dat4	MMC/SD Card Data bit 4	IO	AE4 / AB3	P9 / V10	AB2 / T5
mmc2_dat5	MMC/SD Card Data bit 5	IO	AH3 / AB4	M3/P8	AA2 / R4
mmc2_dat6	MMC/SD Card Data bit 6	IO	AF3 / AA4	L3/P7	Y2 / T4
mmc2_dat7	MMC/SD Card Data bit 7	IO	AE3 / AC2	K3/R7	AA1 / T6
mmc2_dir_cmd	Direction control for CMD signal case an external transceiver is used	O	AF3	L3	Y2
mmc2_cmd	MMC/SD command signal	IO	AG5	R10	AB5
MULTIMEDIA MEMORY CARD (MMC3) / SECURE DIGITAL IO (SDIO3)					
mmc3_clk	MMC/SD Output Clock	O	AB1 / AF10	R9 / AB2	AC1
mmc3_cmd	MMC/SD command signal	IO	AC3 / AE10	R8 / AB3	AD3
mmc3_dat0	MMC/SD Card Data bit 0 / SPI Serial Input	IO	AE4 / AE11	V10 / Y3	AB2 / AC5
mmc3_dat1	MMC/SD Card Data bit 1	IO	AH3 / AH9	M3/AB1	AA2 / AD2
mmc3_dat2	MMC/SD Card Data bit 2	IO	AF3 / AF13	L3/AE3	Y2 / AC8
mmc3_dat3	MMC/SD Card Data bit 3	IO	AE3 / AE13	K3/AA3	AA1 / AD8
mmc3_dat4	MMC/SD Card Data bit 4	IO	AF11	AC3	AD6
mmc3_dat5	MMC/SD Card Data bit 5	IO	AG9	V2	AD5
mmc3_dat6	MMC/SD Card Data bit 6	IO	AF9	AA4	AC4
mmc3_dat7	MMC/SD Card Data bit 7	IO	AH14	AD2	AD9

2.5.5 Test Interfaces

Table 2-19. Test Interfaces – ETK Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
etk_ctl	ETK trace ctl	O	AE10	AB3	AD3
etk_clk	ETK trace clock	O	AF10	AB2	AC1
etk_d0	ETK data 0	O	AF11	AC3	AD6
etk_d1	ETK data 1	O	AG12	AD4	AC6
etk_d2	ETK data 2	O	AH12	AD3	AC7
etk_d3	ETK data 3	O	AE13	AA3	AD8
etk_d4	ETK data 4	O	AE11	Y3	AC5
etk_d5	ETK data 5	O	AH9	AB1	AD2
etk_d6	ETK data 6	O	AF13	AE3	AC8
etk_d7	ETK data 7	O	AH14	AD2	AD9
etk_d8	ETK data 8	O	AF9	AA4	AC4
etk_d9	ETK data 9	O	AG9	V2	AD5
etk_d10	ETK data 10	O	AE7	AE4	AC3
etk_d11	ETK data 11	O	AF7	AF6	AC9
etk_d12	ETK data 12	O	AG7	AE6	AC10
etk_d13	ETK data 13	O	AH7	AF7	AD11
etk_d14	ETK data 14	O	AG8	AF9	AC11
etk_d15	ETK data 15	O	AH8	AE9	AD12

Table 2-20. Test Interfaces – JTAG Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
jtag_ntrst	Test Reset	I	AA17	U15	AB7
jtag_tck	Test Clock	I	AA13	V14	AB6
jtag_rtck	ARM Clock Emulation	O	AA12	W13	AA7
jtag_tms_tmsc	Test Mode Select	IO	AA18	V15	AA9
jtag_tdi	Test Data Input	I	AA20	U16	AB10
jtag_tdo	Test Data Output	O	AA19	Y13	AB9
jtag_emu0	Test emulation 0	IO	AA11	Y15	AC24
jtag_emu1	Test emulation 1	IO	AA10	Y14	AD24

Table 2-21. Test Interfaces – SDTI Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]	SUBSYSTEM SIGNAL MULTIPLEXING [6]
sdti_clk	Serial clock dual edge	O	AF7 / AA11 / AG8	AF6 / Y15 / AF9	AC9 / AC24 / AC11	etk_d11 / jtag_emu0 / etk_d14
sdti_txd0	Serial data out (System Trace messages)	O	AG7 / AA10 / AA11	AE6 / Y14 / Y15	AC10 / AD24 / AC24	etk_d12 / jtag_emu1 / jtag_emu0
sdti_txd1	Serial data out (System Trace messages)	O	AH7 / AA10	AF7 / Y14	AD11 / AD24	etk_d13 / jtag_emu1
sdti_txd2	Serial data out (System Trace messages)	O	AG8	AF9	AC11	etk_d14
sdti_txd3	Serial data out (System Trace messages)	O	AH8	AE9	AD12	etk_d15

Table 2-22. Test Interfaces – HWDBG Signals Description

SIGNAL NAME [1]	DESCRIPTION [2]	TYPE [3]	BALL BOTTOM (CBP Pkg.) [4]	BALL BOTTOM (CBC Pkg.) [4]	BALL BOTTOM (CUS Pkg.) [4]
hw_dbg0	Debug signal 0	O	A24 / AF10	C23/AB2	AC1/A22
hw_dbg1	Debug signal 1	O	A23 / AE10	D23/AB3	AD3/E18
hw_dbg2	Debug signal 2	O	C27/ AF11	C26/AC3	AD6/J19
hw_dbg3	Debug signal 3	O	C23 / AG12	B23/AD4	AC6/H24

(1) NA in table stands for "Not Applicable".

(2) The subsystem pin multiplexing options are not described in Table 2-1 and Table 2-4.

(3) The usage of this GPIO is strongly restricted. For more information, see the General-Purpose Interface / General-Purpose Interface Environment section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

2.5.8 Power Supplies

Note: For more information, see Power Reset and Clock Management / PRCM Environment and the Power, Reset, and Clock Management / PRCM Functional Description / PRCM Voltage Management Functional Description sections of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

3 Electrical Characteristics

NOTE

For more information, see the Power Reset and Clock Management / PRCM Environment section of the AM/DM37x Multimedia Device Technical Reference Manual (literature number SPRUGN4).

3.1 Absolute Maximum Ratings

Stresses beyond those listed as absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under "Recommended Operating Conditions" is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

Table 3-1. Absolute Maximum Rating over Junction Temperature Range

PARAMETER				MIN	MAX	UNIT
vdd_mpu_iva	Supply voltage range for MPU / IVA domain			–0.5	1.5	V
vdd_core	Supply voltage range for core domain			–0.5	1.5	V
vdda_wkup_bg_bb	Supply voltage range for wake-up domain (internal LDO)			–0.5	2.1	V
vdda_dplls_dll	Supply voltage for MPU, IVA, Core DPLLs, and DLL			–0.5	2.1	V
vdda_dpll_per	Supply voltage for DPLLs (peripherals)			–0.5	2.1	V
vdds_sram	Supply voltage for SRAM LDOs			–0.5	2.1	V
vdda_dac	Supply voltage for video buffers and DAC			–0.5	2.1	V
vdds	Supply voltage for 1.8-V I/O macros			–0.5	2.1	V
vdds_mem	Supply voltage for memory buffers			–0.5	2.1	V
vdds_mmc1	Supply voltage range for mmc1 dual voltage IOs			–0.5	3.8	V
vdds_x	Supply voltage range for dual voltage GPIOs			–0.5	3.8	V
V_{ESD}	ESD stress voltage(1)	HBM (Human Body Model)(2)	JTAG(9)	200		V
			CAM(6)	400		
			GPMC(8)	500		
			Other signals	1000		
		CDM (Charged Device Model)(3)		250		
I_{IOI}	Current-pulse injection on each IO pin(5)			200		mA
I_{clamp}	Clamp current for an input or output			–20	20	mA
T_{STG} (4)	Storage temperature range			–65	150	°C

(1) Electrostatic discharge (ESD) to measure device sensitivity/immunity to damage caused by electrostatic discharges into the device.

(2) Level listed above is the passing level per ANSI/ESDA/JEDEC JS-001-2010. JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 500V HBM is possible if necessary precautions are taken. Pins listed as 1000V may actually have higher performance.

(3) Level listed above is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process. Pins listed as 250V may actually have higher performance.

(4) For tape and reel the storage temperature range is [–10°C; +50°C] with a maximum relative humidity of 70%. It is recommended returning to ambient room temperature before usage.

(5) Each device is tested with an IO pin injection of 200 mA with a stress voltage of 1.5 times the maximum Vdd at room temperature.

(6) Corresponding signals: cam_d0, cam_d1, cam_d6, cam_d7, cam_d8, cam_d9. Refer to Multiplexing Characteristicsto determine the ball information per package.

(7) Corresponding signals: dss_data0, dss_data1, dss_data2, dss_data3, dss_data4, dss_data5. Refer to Multiplexing Characteristics to determine the ball information per package.

(8) Corresponding signals: All 46 GPMC interface signals (vdds_mem is not included to this exception list). Refer to Multiplexing Characteristics to determine the ball information per package.

(9) Corresponding signals: All 8 JTAG interface signals (jtag_emu0, jtag_emu1, jtag_ntrst, jtag_rtck, jtag_tck, jtag_tdi, jtag_tdo, jtag_tms_tmsc). Refer to Multiplexing Characteristics to determine the ball information per package.

Table 3-2 summarizes the power consumption at the ball level.

Table 3-2. Maximum Current Ratings at Ball Level (3)

PARAMETER				MAX	UNIT
SIGNAL	DESCRIPTION				
vdd_mpu_iva(7)	Maximum current rating for MPU / IVA domain	Processors	DM3730/DM3725 (1G Hz)	1400(1)(4)	mA
			DM3730/DM3725 (800M Hz)	1200(5)	
			DM3730/DM3725 (600M Hz)	800(5)	
vdd_core(1)	Maximum current rating for core domain	Core	DM3730	300	mA
			DM3725	230	
vdds	Maximum current rating for 1.8-V I/O macros			60	mA
vdds_mem	Maximum current rating for memory buffers			35	mA
vdds_mmc1(2)	Maximum current rating for mmc1 dual voltage buffers			20	mA
vdds_x	Maximum current rating for GPIO dual voltage buffers			2	mA
vdda_wkup_bg_bb	Maximum current rating for wake-up, bandgap and VBB LDOs			5	mA
vdda_dac	Maximum current rating for video buffers and DAC			60	mA
vdda_dplls_dll	Maximum current rating for MPU, IVA, core DPLLs and DLL			30	mA
vdda_dpll_per	Maximum current rating for DPLLs (peripherals)			10	mA
vdds_sram	Maximum current rating for SRAM LDOs (common)			41	mA

(1) With SmartReflex™ enabled.

(2) MMC card and I/O card are not included.

(3) The maximum current ratings documented in this table are preliminary data which are subject to change.

(4) Conditions used for maximum current ratings are worst case:

- T_J is up to 90C
- Cold process is used
- V_{DD1} (vdd_mpu_iva) supplies 1.38 V (maximum voltage supported)

In these conditions, the current listed as 1400mV is the addition of the:
- Current when running Dhrystone on ARM@1GHz multiplied by a factor x1.5 (to take care of NEON activity)
- Current when running H.264 on IVA@800MHz with a x1.1 factor (to take care of more aggressive SW than H.264)

(5) Conditions used for maximum current ratings are worst case:

- T_J is up to 90C
- Hot process is used
- V_{DD1} (vdd_mpu_iva) nominal OPP voltage:
  - DM3730 (800M Hz): @1.27V
  - DM3730 (600M Hz): @1.14V

(6) This maximum vdd_mpu_iva current is observed at OPP1G operating point.

(7) Depending on the microprocessor chosen, the IVA feature may or may not be supported. See the Features section for more information on device features.

3.2 Recommended Operating Conditions

The device is used under the recommended operating conditions described in Table 3-4. The POH information in Table 3-3 is provided solely for your convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI semiconductor products.

Table 3-3. Reliability Data

JUNCTION TEMP	TOTAL DEVICE LIFETIME	≥OPP130 MAX TIME	OPP1G MAX TIME
@105C	89K POH	Not available	Not available
@90C	100K POH	45K	25K(1)
@75C	>100K POH	100K POH	75K

(1) If device is only operated at OPP1G, then POH can be extended to 35K POH.

NOTE

Logic functions and parameter values are not assured out of the range specified in the recommended operating conditions.

Table 3-4. Recommended Operating Conditions

PARAMETER	DESCRIPTION		MIN	NOM	MAX	UNIT
vdd_mpu_iva	Supply voltage range for ARM / IVA domain			See(1)		V
	Maximum Noise (peak-peak)			40		mV_{PP}
vdd_core	Supply voltage range for core domain			See(1)		V
	Maximum Noise (peak-peak)			40		mV_{PP}
vdds	Supply voltage for 1.8-V I/O macros		1.71	1.80	1.91	V
	Maximum Noise (peak-peak)	Oscillator IO (Crystal or Square modes)		40		mV_{PP}
		Others		90		
vdds_mem	Supply voltage for memory buffers		1.71	1.80	1.91	V
	Maximum Noise (peak-peak)			90		mV_{PP}
vdds_mmc1	Supply voltage range for mmc1 dual voltage IOs	1.8-V mode	1.71	1.80	1.91	V
		3.0-V mode	2.70	3.00 to 3.30	3.60	
	Noise (peak-peak)	1.8-V mode		90		mV_{PP}
		3.0-V mode		150		
vdds_x	Supply voltage range for x dual voltage IOs	1.8-V mode	1.71	1.80	1.91	V
		3.0-V mode	2.70	3.00	3.60	
	Maximum Noise (peak-peak)	1.8-V mode		90		mV_{PP}
		3.0-V mode		150		
vdda_wkup_bg_bb	Supply voltage range for wake-up LDO		1.71	1.80	1.91	V
	Maximum Noise (peak-peak)			50		mV_{PP}
vdda_dac	Analog supply voltage for Video DAC		1.71	1.80	1.91	V
	Maximum Noise (peak-peak) for a frequency from 0 to 100 kHz (For a frequency > 100 kHz, decreases 20 dB/dec)			30		mV_{PP}
vdds_sram	Supply voltage for SRAM LDOs		1.71	1.80	1.91	V
	Maximum Noise (peak-peak)			50		mV_{PP}
vdda_dplls_dll	Supply voltage for MPU, IVA, core DPLLs and DLL		1.71	1.80	1.91	V
	Maximum Noise (peak-peak) For any frequency			30		mV_{PP}

Table 3-4. Recommended Operating Conditions (continued)

PARAMETER	DESCRIPTION		MIN	NOM	MAX	UNIT
vdda_dpll_per	Supply voltage for DPLLs (peripherals)		1.71	1.80	1.91	V
	Maximum Noise (peak-peak) For any frequency			50		mV_{PP}
vssa_dac	Ground for video buffers and DAC			0		V
vss	Main ground			0		V
T_J	Operating junction temperature range	Commercial Temperature	0		90	°C
		Industrial Temperature	-40		90	
		Extended Temperature	-40		105	

(1) See Section 4.3.4, *Processor Clocks*. OPP voltage values may change following the silicon characterization result.

3.3 DC Electrical Characteristics

Table 3-5 summarizes the dc electrical characteristics.

Note: The interfaces or signals described in Table 3-5 correspond to the interfaces or signals available in multiplexing mode 0. All interfaces or signals multiplexed on the balls / pins described in Table 3-5 have the same DC electrical characteristics.

Table 3-5. DC Electrical Characteristics

PARAMETER			MIN	NOM	MAX	UNIT
SDRC Mode (CBP Balls[19]: C14 / B14 / C15 / B16 / D17 / C17 / B17 / D18 / H9 / H10 / H11 / H12 / A13 / A14 / H16 / H17 / H14 / H13 / H15 / A16 / A17)[4]						
V_{IH}	High-level input voltage		0.7 * vdds_mem			V
V_{IL}	Low-level input voltage				0.3 * vdds_mem	V

CAM, HSUSB0, MMC2, UART1, UART2, McBSP, McSPI, ETK Interfaces, sys_clkout2 (CBP Ball[19]: AE22)						
t_{TOUT}	Output transition time (rise time, t_{ROUT} or fall time, t_{FOUT} evaluated between 10% and 90% at PAD)		1.5		5	ns
C_{TOUT}	Output load		2		22	pF
Otherwise						
t_{TOUT}	Output transition time (rise time, t_{ROUT} or fall time, t_{FOUT} evaluated between 10% and 90% at PAD)		0.6		2.4[17]	ns
C_{TOUT}	Output load		2		22	pF
Hysteresis						
sys_xtalin pin (CBP Ball[19]: AE17)						
V_{HYS}[1]	Hysteresis voltage at an input		0.25			V
hsusb0_clk (CBP Ball[19]: T28)						
V_{HYS}[1]	Hysteresis voltage at an input		0.07			V
Otherwise						
V_{HYS}[1]	Hysteresis voltage at an input		0.15			V

(1) V_{hys} is the magnitude of the difference between the positive-going threshold voltage V_{T+} and the negative-going threshold voltage V_{T-}. Some receivers, but not all, are designed for hysteresis. V_{hys} applies only to those that are.

(2) The t_{IN} (t_{RIN} and t_{FIN} also) value is the recommended condition. The t_{IN} (t_{RIN} and t_{FIN} also) mismatch causes additional delay time inside the device then leads to ac timing invalidation in this DM.

The t_{IN} (t_{RIN} and t_{FIN} also) mismatch does not necessarily mean functional failure. This global value may be overridden on a per interface basis if another value is explicitly defined for that interface in the Timing Requirements and Switching Characteristics chapter of the data manual.

(3) For a full description of the DS0 load compensation register configuration, see the description of the CONTROL_PROG_IO1 configuration registers in System Control Module / Programming Model / Feature Settings / SDRC I/O Drive Strength Selection section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(4) For a full description of the SPEEDCTRL speed register configuration, see the description of the CONTROL_PROG_IO1 configuration registers in System Control Module / Programming Model / Feature Settings section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(5) Rise and fall times are specified for (0.3 * vdds) to (0.7 * vdds).

(6) For capacitive load from 100 pF to 400 pF, fall time should be linearly interpolated:
t_{Fmin} = (1 + (Load – 100 pF) / 300 pF) * 10 ns
t_{Fmax} = (1 + (Load – 100 pF) / 300 pF) * 40 ns

(7) V_{IH} is the voltage at which the receiver is required to detect a high state in the input signal.

(8) V_{IL} is the voltage at which the receiver is required to detect a low state in the input signal. V_{IL} is larger than the maximum single-ended line voltage during HS transmission. Therefore, both LP receivers will detect low during HS signaling.

(9) This value includes a ground difference of 50 mV between the transmitter and the receiver, the status common-mode level tolerance and variations below 450 MHz.

(10) Common mode is defined as the average voltage level of DX and DY: $V_{CM} = (V_{(DX)} + V_{(DY)})/2$. Common mode ripple may be due to rise-fall time and transmission line impairments in the PCB.

(11) Value when driving into differential load impedance anywhere in the range 80 to 125 Ω.

(12) ULPM stands for Ultra Low Power Mode.

(13) UI = 1 / (2 * fh), where fh is the fundamental frequency of HS data transmission. For example, for 800 Mbps fh is 400 MHz.

(14) vdda_x can be vdda_csiphy1 or vdda_csiphy2 depending on the interface used.

(15) At minimum load.

(16) At maximum load. Caution: This creates EMI parasitics up to 1.2 ns.

(17) For more information about IOH / IOL values, see one of the tables in the Ball Characteristics section, column “BUFFER DRIVE STRENGTH (mA) ”.

(18) No V_{OL} specifications are applicable in Standard mode.

(19) For associated CBC and CUS balls, please refer to the Section 2.4, *Multiplexing Characteristics* table.

3.4 External Capacitors

To improve module performance, decoupling capacitors are required to suppress the switching noise generated by high frequency and to stabilize the supply voltage. A decoupling capacitor is most effective when it is close to the device, because this minimizes the inductance of the circuit board wiring and interconnects.

3.4.1 Voltage Decoupling Capacitors

Table 3-6 summarizes the Core voltage decoupling characteristics.

3.4.1.1 Core Voltage Decoupling Capacitors

To improve module performance, decoupling capacitors are required to suppress the switching noise generated by high frequency and to stabilize the supply voltage. A decoupling capacitor is most effective when it is close to the device, because this minimizes the inductance of the circuit board wiring and interconnects.

Table 3-6. Core Voltage Decoupling Characteristics

PARAMETER	MIN	TYP	MAX	UNIT
C_{vdd_core} (1)	0.6	1.2	1.8	µF
$C_{vdd\_mpu\_iva}$ (2)	See (2)			µF

(1) The typical value corresponds to 2 capacitors of 470 nF, plus 3 capacitors of 100 nF. Except for the decoupling capacitance values, the PCB rules of the PCB Design Requirements for VDD_MPU_IVA Power Distribution Network for TI OMAP3630, AM37xx, and DM37xx Microprocessors (SPRABJ7) application note can be used.

(2) For more information regarding the vdd_mpu_iva decoupling capacitance recommendations, see the PCB Design Requirements for VDD_MPU_IVA Power Distribution Network for TI OMAP3630, AM37xx, and DM37xx Microprocessors (SPRABJ7) application note.

3.4.1.2 IO and Analog Voltage Decoupling Capacitors

Table 3-7 summarizes the power supply decoupling capacitor characteristics.

Table 3-7. Power Supply Decoupling Capacitor Characteristics

PARAMETER	MIN	TYP	MAX	UNIT
C_{vdds} (1)(2)	200	400	600	nF
C_{vdds_mem} (1)(3)	350	700	1050	nF
C_{vdds_mmc1} (4)	50	100	150	nF
C_{vdds_x} (4)	50	100	150	nF
$C_{vdda\_dplls\_dll}$ (4)	50	100	150	nF
$C_{vdda\_dpll\_per}$ (4)	50	100	150	nF
C_{vdds_sram} (4)	110	220	330	nF
$C_{vdda\_wkup\_bg\_bb}$ (4)	240	470	700	nF
C_{vdda_dac} (4)	50	100	150	nF

(1) In power plan configuration.

(2) The typical value corresponds to 4 capacitors of 100 nF.

(3) The typical value corresponds to 7 capacitors of 100 nF.

(4) In power rail configuration.

3.4.2 Output Capacitors

The capacitors at the outputs are required to stabilize the internal LDO supply voltages. The capacitors must be placed as close as possible to the balls.

Table 3-8 summarizes the power supply decoupling characteristics.

Table 3-8. Output Capacitor Characteristics

PARAMETER	MIN	TYP	MAX	UNIT
$C_{cap\_vdd\_sram\_mpu\_iva}$	0.7	1	1.3	µF
$C_{cap\_vdd\_sram\_core}$	0.7	1	1.3	µF
$C_{cap\_vddu\_wkup\_logic}$	0.7	1	1.3	µF
$C_{cap\_vddu\_array}$	0.7	1	1.3	µF
$C_{cap\_vdd\_bb\_mpu\_iva}$	0.7	1	1.3	µF

Figure 3-1 illustrates an example of the external capacitors.

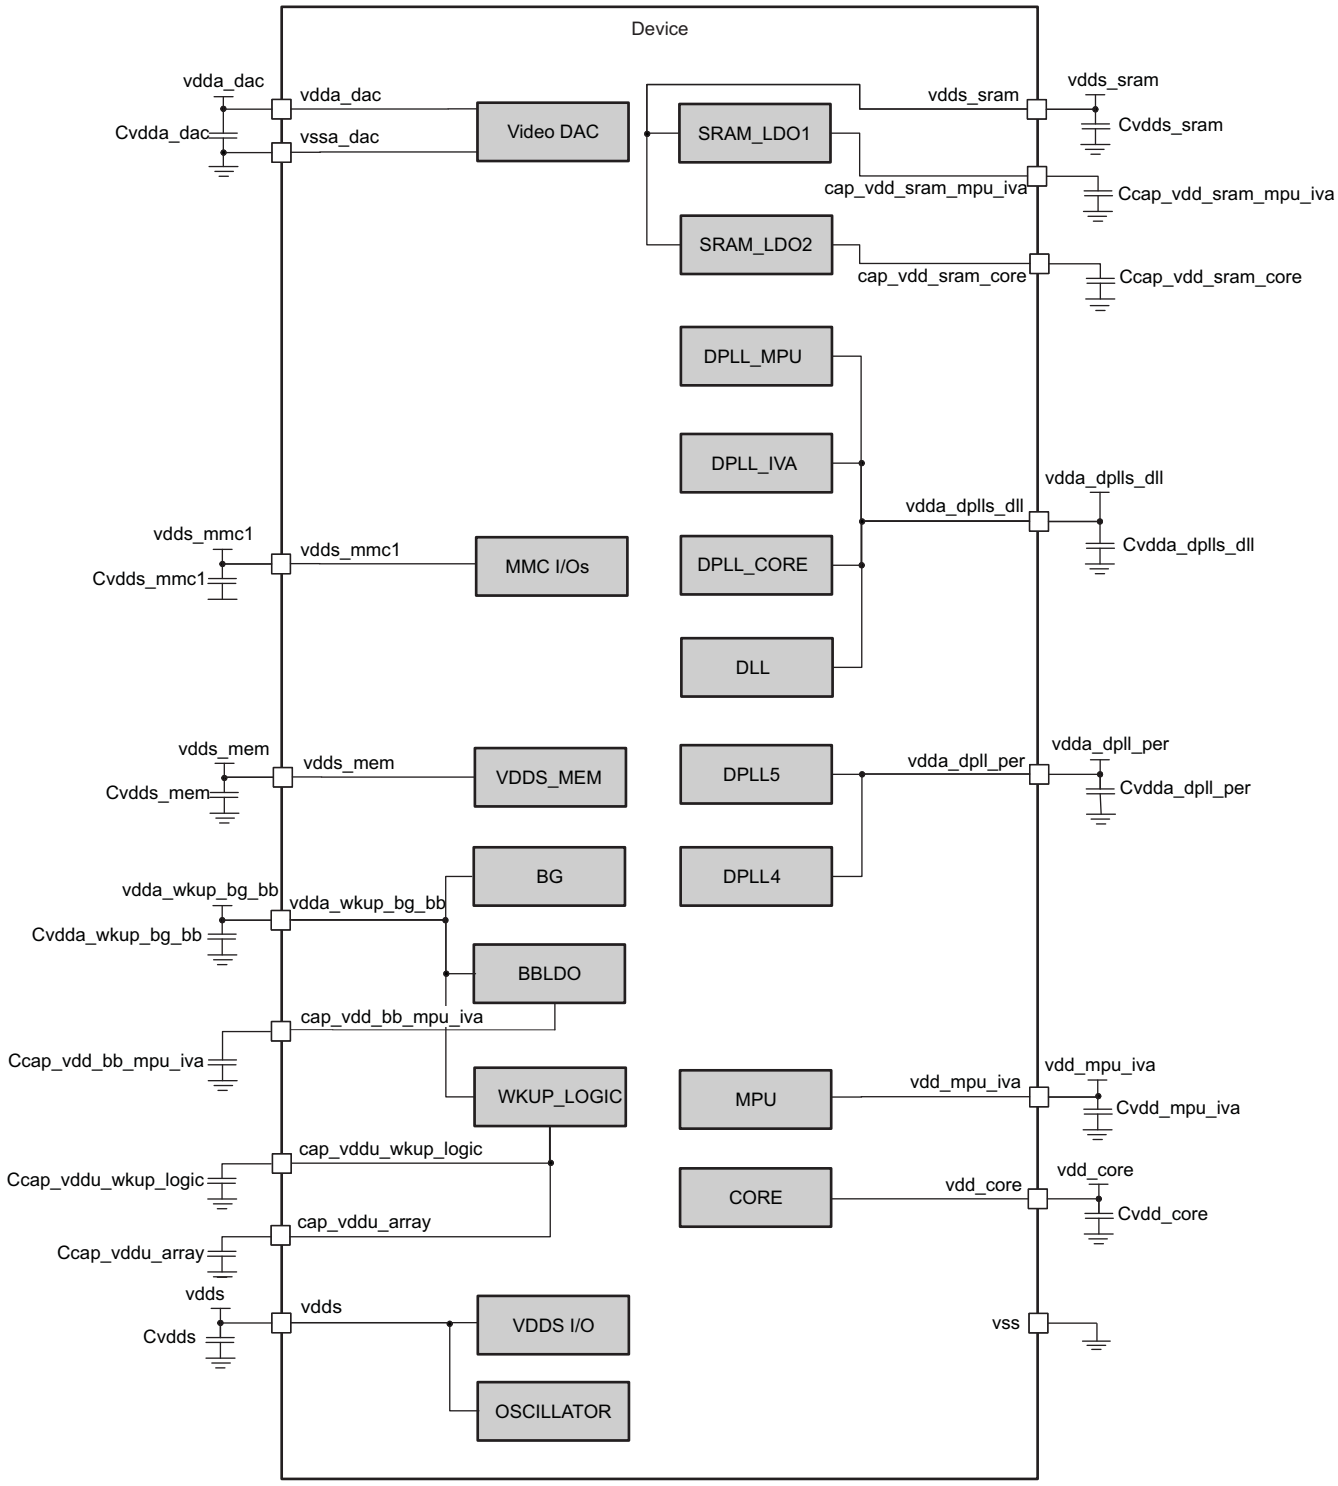

Figure 3-1. External Capacitors

NOTE

- Decoupling capacitors must be placed as closed as possible of the power ball. Choose the ground located closest to the power pin for each decoupling capacitor. In case of interconnecting powers, first insert the decoupling capacitor and then interconnect the powers.
- The decoupling capacitor value depends on the board characteristics.

3.5 Power-Up and Power-Down Sequences

This section provides the timing requirements for the device hardware signals.

NOTE

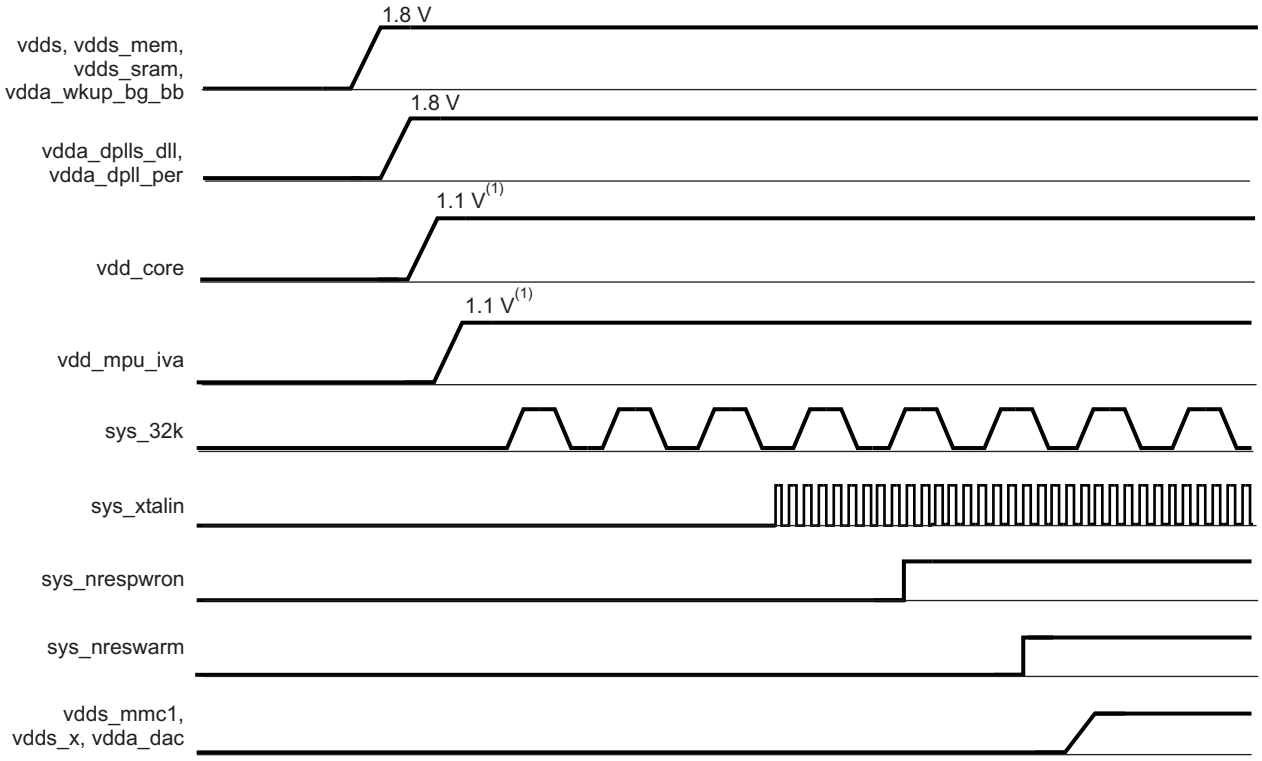
- If the MMC dual voltages interfaces are used with 1.8-V or 3.0-V, then the power-up and power-down sequences specified in the Figure 3-2 and Figure 3-3 must be followed carefully to avoid any significant current consumption.
- If the MMC dual voltages interfaces are used with 1.8-V only (3.0-V is never used), then vdds_mmc1, vdds_x may be connected to the main power supply vdds so that they ramp up together before vdd_core.

3.5.1 Power-Up Sequence

NOTE

For more information, see the Power, Reset, and Clock Management / PRCM Functional Description / PRCM Reset Manager Functional Description / Reset Sequences of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Figure 3-2 shows the power-up sequence.



(1) 1.2 V supported.

(2) If an external square clock is provided, it could be started after sys_nrespwron release, provided it is clean, i.e. no glitch, stable frequency and duty cycle.

(3) sys_32k can be turned on any time between the vdds ramp-up and the sys_nrespwron release.

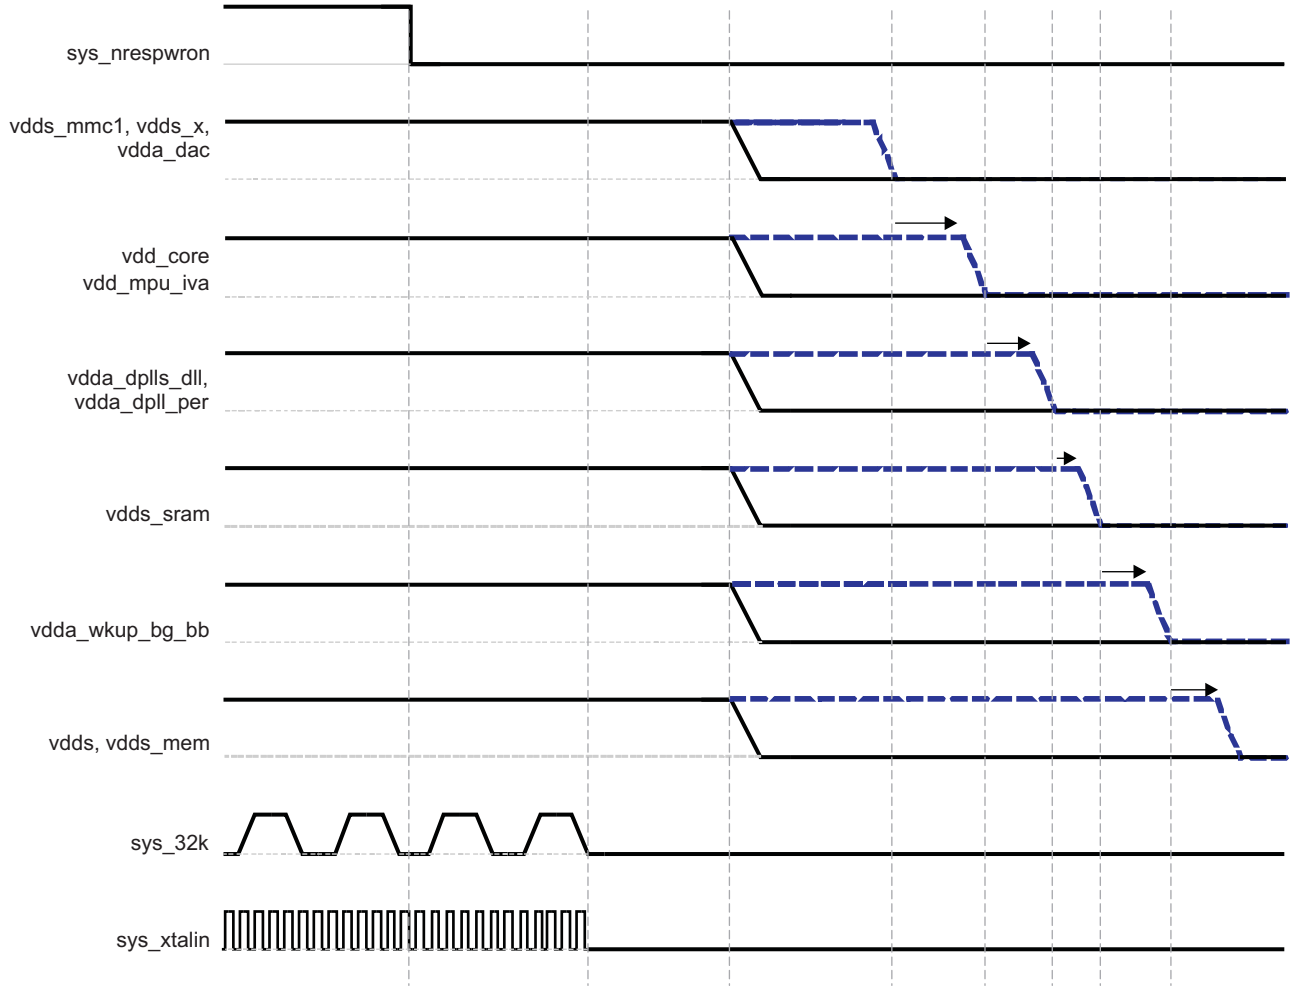
Figure 3-2. Power-Up Sequence

3.5.2 Power-Down Sequence

The following steps give two examples of power-down sequence supported by the DM37x device.

1. Put the DM37x device under reset (sys_nrespwron)
2. Stop all signals driven to its balls (sys_32k, sys_xtalin)
3. Either:
   (a) Shutdown all power domains at once. This sequence is described in black color in Figure 3-3.
   (b) Or, if the shutdown is sequenced, you must follow these steps (described in dash style blue color in Figure 3-3):
   - Turn off all complex IO domains (vdds_mmc1, vdds_x)
   - Turn off all the core and MPU domains (vdd_core, vdd_mpu_iva)
   - Turn off all DPLL domains (vdda_dplls_dll, vdda_dpll_per)
   - Turn off all sram LDOs (vdds_sram)
   - Turn off all reference domains (vdda_wkup_bg_bb)
   - Turn off all standard IO domains (vdds, vdds_mem)

Figure 3-3 shows both power-down sequences: one of them is described in black color, and the other one in dash style blue.



A. sys_32k can be turned off any time between the sys_nrespwron assertion and the vdds shut down.

Figure 3-3. Power-Down Sequence

Alternate power-down sequence:

- vdd_mpu_iva shuts down before vdd_core.
- vdda_sram, vdda_wkup_bg_bb, vdds and vdds_mem shut down simultaneously.
- vdda_dplls_dll and vdda_dpll_per shut down anytime between all complex IO domains shut down and vdda_sram shuts down.

4 Clock Specifications

NOTE

For more information, see the Power, Reset, and Clock Management / PRCM Environment / External Clock Signal and Power, Reset and Clock Management / PRCM Functional Description / PRCM Clock Manager Functional Description sections of the *AM/DM37x Multimedia Device Technical Reference Manual* (SPRUGN4).

Figure 4-1 shows external input clock sources and output clocks.

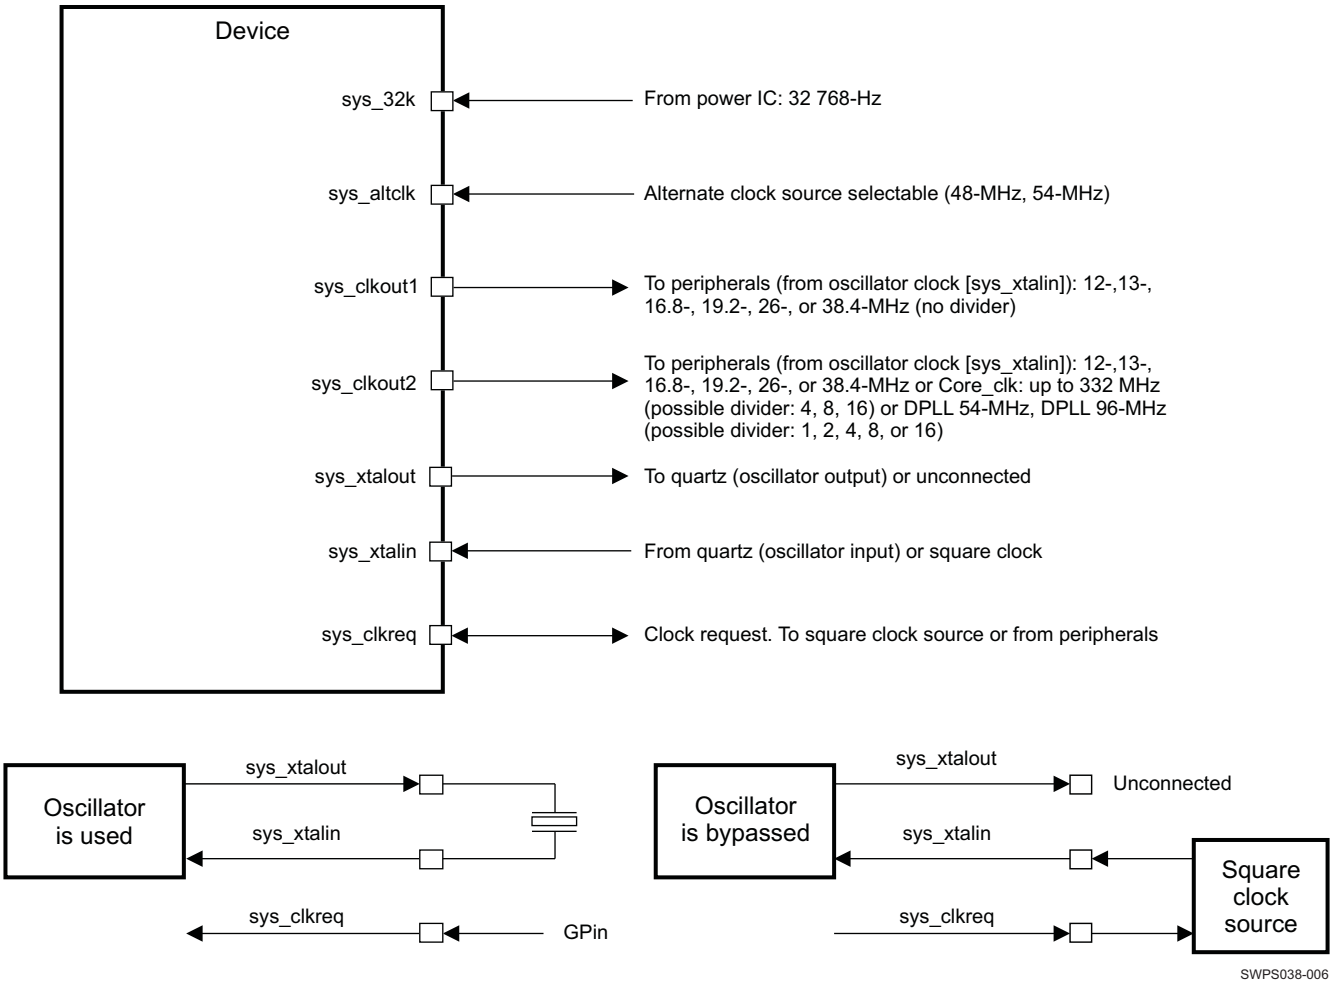


Figure 4-1. Clock Interface

The device operation requires the following three input clocks:

- The sys_32k 32-kHz clock is used for low frequency operation. It supplies the wake-up domain for operation in lowest power mode (off mode). This clock is provided through the sys_32k pin.
- The sys_altclk system alternative clock can be used (through the sys_altclk pin) to provide alternative 48 MHz or 54 MHz.
- The sys_xtalin / sys_xtalout system input clock (12, 13, 16.8, 19.2, 26, or 38.4 MHz) is used to generate the main source clock of the device. It supplies the DPLLs as well as several other modules. The system input clock can be connected to either:
  - A crystal oscillator clock managed by sys_xtalin and sys_xtalout. In this case, the sys_clkreq is used as an input (GPIN).
  - A CMOS digital clock through the sys_xtalin pin. In this case, the sys_clkreq is used as an output to request the external system clock.

The device outputs externally two clocks:

- sys_clkout1 can output the oscillator clock (12, 13, 16.8, 19.2, 26, or 38.4 MHz) at any time. It can be controlled by software or externally using sys_clkreq control. When the device is in the off state, the sys_clkreq can be asserted to enable the oscillator and activate the sys_clkout1 without waking up the device. The off state polarity of sys_clkout1 is programmable.
- sys_clkout2 can output the oscillator clock (12, 13, 16.8, 19.2, 26, or 38.4 MHz), core_clk (core DPLL output), 96 MHz or 54 MHz. It can be divided by 2, 4, 8, or 16 and its off state polarity is programmable. This output is active only when the core power domain is active.

4.1 Input Clock Specifications

4.1.1 Input Clock Requirements

Table 4-1 illustrates the requirements to supply a clock to the device.

Table 4-1. Input Clock Requirements (4)

PAD	CLOCK FREQUENCY		STABILITY	DUTY CYCLE	JITTER	TRANSITION
sys_32k	32.768 kHz		+/- 200 ppm	-	-	<10 ns
sys_xtalout sys_xtalin	12, 13, 16.8, or 19.2 MHz	Crystal	±50 ppm (±5 ppm)(1)	-	-	-
	12, 13, 16.8, 19.2, 26, or 38.4 MHz	Square	±50 ppm (±5 ppm)(1)	45% to 55%	X%(2) * tc(xtalin)(3) - 200ps	10 ns
sys_altclk	48 or 54 MHz		+/-50 ppm	49% to 51%	<1%	10 ns

(1) ± 50 ppm is the clock frequency stability/accuracy and ± 5 ppm takes into account the aging effects.

(2) Depending on the internal system clock divider configuration (PRCM.PRM_CLKSRC_CTRL[7:6], SYSCLKDIV bit field), the sys_xtalin input clock can be divided by 2 to provide the standard system clock (SYS_CLK) frequencies.

For more information, see the Power, Reset, and Clock Management chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (SPRUGN4). In X%, X represents then the internal system clock divider with following possible values: X = 1 or 2.

(3) tc(xtalin) is the sys_xtalin cycle time of the clock coming to sys_xtalin ball.

(4) In this table, the transition times are calculated for 10%-90% of VDDS. For more information on the corresponding VDDS power supply name, please see the Ball Characteristics table corresponding to your package. The POWER column defines the VDDS power supply for each ball.

4.1.2 sys_xtalin / sys_xtalout External Crystal

An external crystal is connected to the device pins. Figure 4-2 describes the crystal implementation.

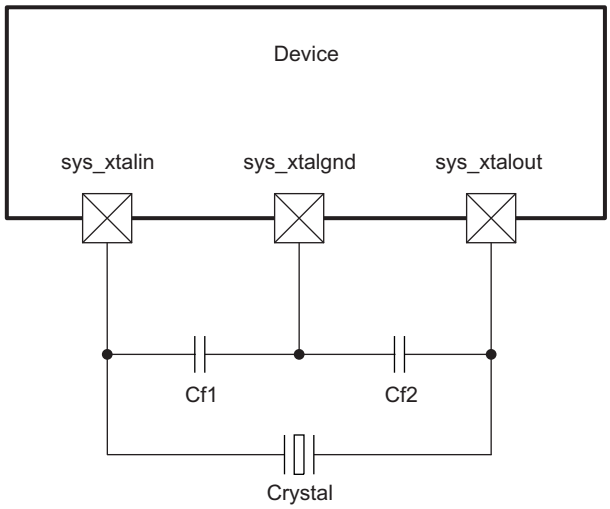

Figure 4-2. Crystal Implementation

1. When the crystal oscillator is in bypass mode (crystal implementation is unused), the sys_xtalgnd ball is not connected.

The crystal must be in the fundamental mode of operation and parallel resonant. Table 4-2 summarizes the required electrical constraints.

Table 4-2. Crystal Electrical Characteristics(1)

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f_p	Parallel resonance crystal frequency(1)	12, 13, 16.8, or 19.2			MHz
C_{f1}	C_{f1} load capacitance for crystal parallel resonance with $C_{f1} = C_{f2}$	12		24	pF
C_{f2}	C_{f2} load capacitance for crystal parallel resonance with $C_{f1} = C_{f2}$	12		24	pF
ESR(C_{f1},C_{f2})(2)	Frequency 12 MHz , Negative resistor at nominal 500 Ω, Negative resistor at worst case 300 Ω			100	Ω
	Frequency 13 MHz, Negative resistor at nominal 400 Ω, Negative resistor at worst case 240 Ω			80	Ω
	Frequency 16.8 MHz and 19.2 MHz, Negative resistor at nominal 300 Ω, Negative resistor at worst case 180 Ω			60	Ω
C_o	Crystal shunt capacitance			4.5	pF
DL	Crystal drive level			0.5	mW

(1) Measured with the load capacitance specified by the crystal manufacturer. This load is defined by the foot capacitances tied in series. If C_L = 20 pF, then both foot capacitors will be $C_{f1} = C_{f2}$ = 40 pF. Parasitic capacitance from package and board must also be taken in account.

(2) The crystal motional resistance R_m is related to the equivalent series resistance (ESR) by the following formula: $ESR = R_m * (1 + (C_O * C_{f1} * C_{f2} / (C_{f1} + C_{f2})))^2$.

When selecting a crystal, the system design must take into account the temperature and aging characteristics of a crystal versus the user environment and expected lifetime of the system.

Table 4-3 details the switching characteristics of the oscillator and the requirements of the input clock.

Table 4-3. Oscillator Switching Characteristics—Crystal Mode

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f_p	Oscillation frequency	12, 13, 16.8, or 19.2			MHz
t_{sX}	Start-up time(1) (2)	3			ms

(1) Start-up time is defined as the time the oscillator takes to gain sys_xtalin amplitude enough to have 45% to 55% duty cycle at the core input from the time power down (PWRDN) is released. Start-up time is a strong function of crystal parameters. At power-on reset, the time is adjustable using the pin itself. The reset must be released when the oscillator or clock source is stable. To switch from bypass mode to crystal or from crystal mode to bypass mode, there is a waiting time about 100 µs; however, if the chip comes from bypass mode to crystal mode then the crystal will start-up after time mentioned in the t_{sX} parameter.

(2) Before the processor boots up and the oscillator is set to bypass mode, there is a waiting time when the internal oscillator is in application mode and receives a square wave. The switching time in this case is about 100 µs.

4.1.3 sys_xtalin Squarer Input Clock

Table 4-4 summarizes the base oscillator electrical characteristics.

Table 4-4. Oscillator Electrical Characteristics—Bypass Mode

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency	12, 13, 16.8, 19.2, 26, or 38.4			MHz
C_i	Input Capacitance	1.00	1.15	1.35	pF
R_i	Input Resistance	160	216	280	Ω
t_{sX}	Start-up time(1)	See(2)			ms

(1) To switch from bypass mode to crystal mode or from crystal mode to bypass mode, there is a waiting time about 100 µs; however, if the chip comes from bypass mode to crystal mode then the crystal will start-up after time mentioned in Table 4-3, t_{sX} parameter above.

(2) Before the processor boots up and the oscillator is set to bypass mode, there is a waiting time when the internal oscillator is in application mode and receives a square wave. The switching time in this case is about 100 µs.

Table 4-5 details the squarer input clock timing requirements.

Table 4-5. sys_xtalin Squarer Input Clock Timing Requirements—Bypass Mode (5)

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
OCS0	$1 / t_{c(xtalin)}$	Frequency, sys_xtalin	12, 13, 16.8, 19.2, 26, or 38.4			MHz
OCS1	$t_{w(xtalin)}$	Pulse duration, sys_xtalin low or high	0.45 * $t_{c(xtalin)}$		0.55 * $t_{c(xtalin)}$	ns
	$t_{J(xtalin)}$	Peak-to-peak jitter(1), sys_xtalin			X%(2) * tc(xtalin) (3) - 200	ps
	$t_{R(xtalin)}$	Rise time, sys_xtalin			10	ns
	$t_{F(xtalin)}$	Fall time, sys_xtalin			10	ns
	$t_{J(xtalin)}$	Frequency stability, sys_xtalin			+/-50 (+/-5ppm)(4)	ppm

(1)
- Peak-to-peak jitter is meant here as follows:
  - The maximum value is the difference between the longest measured clock period and the expected clock period
  - The minimum value is the difference between the shortest measured clock period and the expected clock period Maximum and minimum are obtained on a statistical population of 300 period samples and expressed relative to the expected clock period

(2) Depending on the internal system clock divider configuration (PRCM.PRM_CLKSRC_CTRL[7:6], SYSCLKDIV bit field), the sys_xtalin input clock can be divided by 2 to provide the standard system clock (SYS_CLK) frequencies. For more information, see the Power, Reset, and Clock Management chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (SPRUGN4). In X%, X represents then the internal system clock divider with following possible values: X = 1 or 2.

(3) tc(xtalin) is the sys_xtalin cycle time of the clock coming to sys_xtalin ball.

(4) ±50 ppm is the clock frequency stability/accuracy and ±5 ppm takes into account the aging effects.

(5) In this table, the transition times are calculated for 10%-90% of VDDS. For more information on the corresponding VDDS power supply name, please see the Ball Characteristics table corresponding to your package. The POWER column defines the VDDS power supply for each ball.

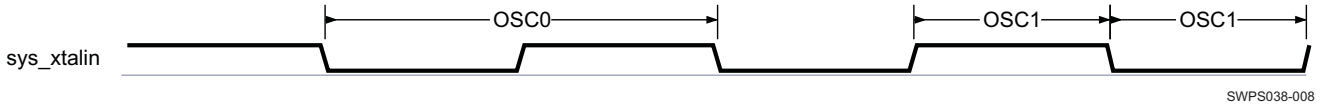

Figure 4-3. sys_xtalin Squarer Input Clock

4.1.4 sys_32k CMOS Input Clock

Table 4-6 summarizes the electrical characteristics of the sys_32k input clock.

Table 4-6. sys_32k Input Clock Electrical Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency, sys_32k		32.768		kHz
C_i	Input capacitance			1.6	pF
R_i	Input resistance	3		10^6	MΩ

Table 4-7 details the input requirements of the sys_32k input clock.

Table 4-7. sys_32k Input Clock Timing Requirements(1)

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
CK0	$1 / t_{c(32k)}$	Frequency, sys_32k		32.768		kHz
	$t_{R(32k)}$	Rise time, sys_32k			10	ns
	$t_{F(32k)}$	Fall time, sys_32k			10	ns
	$t_{J(32k)}$	Frequency stability, sys_32k			200	ppm

(1) In this table, the transition times are calculated for 10%-90% of VDDS. For more information on the corresponding VDDS power supply name, please see the Ball Characteristics table corresponding to your package. The POWER column defines the VDDS power supply for each ball.

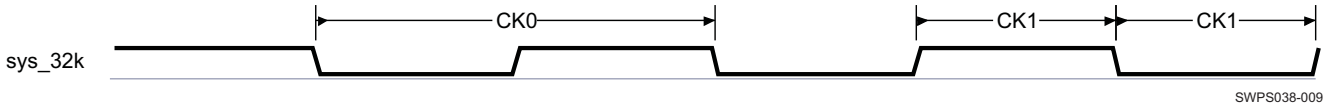

Figure 4-4. sys_32k Input Clock

4.1.5 sys_altclk CMOS Input Clock

Table 4-8 summarizes the electrical characteristics of the sys_altclk input clock.

Table 4-8. sys_altclk Input Clock Electrical Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency, sys_altclk		48 or 54		MHz
Ci	Input capacitance			1.6	pF
Ri	Input resistance	3		10^6	MΩ

Table 4-9 details the input requirements of the sys_altclk input clock.

Table 4-9. sys_altclk Input Clock Timing Requirements(2)

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
ALT0	$1 / t_{c(altclk)}$	Frequency, sys_altclk		48 or 54		MHz
ALT1	$t_{w(altclk)}$	Pulse duration, sys_altclk low or high	0.49 * $t_{c(altclk)}$		0.51 * $t_{c(altclk)}$	ns
	$t_{J(altclk)}$	Peak-to-peak jitter(1), sys_altclk	-1%		1%	
	$t_{R(altclk)}$	Rise time, sys_altclk			10	ns
	$t_{F(altclk)}$	Fall time, sys_altclk			10	ns
	$t_{J(altclk)}$	Frequency stability, sys_altclk			50	ppm

(1) Peak-to-peak jitter is meant here as follows:
- The maximum value is the difference between the longest measured clock period and the expected clock period
- The minimum value is the difference between the shortest measured clock period and the expected clock period Maximum and minimum are obtained on a statistical population of 300 period samples and expressed relative to the expected clock period

(2) In this table, the transition times are calculated for 10%-90% of VDDS. For more information on the corresponding VDDS power supply name, please see the Ball Characteristics table corresponding to your package. The POWER column defines the VDDS power supply for each ball.

4.2 Output Clocks Specifications

4.2.1 sys_clkout1 Output Clock

Table 4-10 summarizes the sys_clkout1 ouput clock electrical characteristics.

Table 4-10. sys_clkout1 Output Clock Electrical Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency, sys_clkout1	sys_xtalin / sys_xtalout clock frequency			MHz
SC[0:1] = 00(1)					
C_L	Load capacitance (transmission line load + far end load)	4		60	pF
Z_T	Transmission line impedance	30		70	Ω
L_T	Transmission line length	2		20	cm
SC[0:1] = 01(1)					
C_L	Load capacitance (transmission line load + far end load)	7		33	pF
Z_T	Transmission line impedance	30		70	Ω
L_T	Transmission line length	2		8	cm
SC[0:1] = 10(1)					
C_L	Load capacitance (transmission line load + far end load)	2		21	pF
Z_T	Transmission line impedance	30		70	Ω
L_T	Transmission line length	1		6	cm

(1) The mode is configured by bits SC0 and SC1 of the IO cell. For more details, see the *AM/DM37x Multimedia Device Technical Reference Manual* (SPRUGN4).

Table 4-11 details the sys_clkout1 ouput clock switching characteristics.

Table 4-11. sys_clkout1 Output Clock Switching Characteristics(6)

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
CO0	1 / $t_{c(CLKOUT1)}$	Frequency, sys_clkout1	sys_xtalin/sys_xtalout clock frequency			MHz
SC[0:1] = 00(1)						
	C_L	Load capacitance	4		60	pF
	t_J	Peak-to-peak jitter			X(5) + 693	ps
	t_{JC2C}	Cycle-to-cycle jitter			X(5) + 705	ps
	$t_{W(CLKOUT1)}$	Pulse duration, sys_clkout1 low or high	0.45*$t_{c(CLKOUT1)}$		0.55*$t_{c(CLKOUT1)}$	
	$t_{R(CLKOUT1)}$	Rise time, sys_clkout1	1(2) (4)		15(3)	ns
	$t_{F(CLKOUT1)}$	Fall time, sys_clkout1	1(2) (4)		15(3)	ns
SC[0:1] = 01(1)						
	C_L	Load capacitance	7		33	pF
	t_J	Peak-to-peak jitter			X(5) + 543	ps
	t_{JC2C}	Cycle-to-cycle jitter			X(5) + 555	ps
	$t_{W(CLKOUT1)}$	Pulse duration, sys_clkout1 low or high	0.45*$t_{c(CLKOUT1)}$		0.55*$t_{c(CLKOUT1)}$	
	$t_{R(CLKOUT1)}$	Rise time, sys_clkout1	0.6(2) (4)		7(3)	ns
	$t_{F(CLKOUT1)}$	Fall time, sys_clkout1	0.6(2) (4)		7(3)	ns
SC[0:1] = 10(1)						
	C_L	Load capacitance	2		21	pF
	t_J	Peak-to-peak jitter			X(5) + 603	ps
	t_{JC2C}	Cycle-to-cycle jitter			X(5) + 615	ps
	$t_{W(CLKOUT1)}$	Pulse duration, sys_clkout1 low or high	0.47*$t_{c(CLKOUT1)}$		0.53*$t_{c(CLKOUT1)}$	
	$t_{R(CLKOUT1)}$	Rise time, sys_clkout1	0.4(2) (4)		5(3)	ns

Table 4-11. sys_clkout1 Output Clock Switching Characteristics[6] (continued)

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
	$t_{F(CLKOUT1)}$	Fall time, sys_clkout1	0.4[2] [4]		5[3]	ns

(1) The mode is configured by bits SC0 and SC1 of the IO cell. For more details, see the *AM/DM37x Multimedia Device Technical Reference Manual* (SPRUGN4).

(2) At minimum load

(3) At maximum load (Maximum frequency 20 MHz)

(4) Caution: this creates EMI parasitics up to 1.2 ns

(5) X parameter corresponds to the input jitter contribution added at sys_xtalin input pin. For more information regarding the sys_xtalin input jitter requirement, see Section 4.1.1.

(6) In this table, the transition times are calculated for 10%-90% of VDDS. For more information on the corresponding VDDS power supply name, please see the Ball Characteristics table corresponding to your package. The POWER column defines the VDDS power supply for each ball.

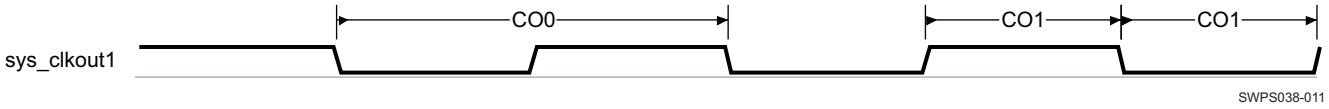

Figure 4-6. sys_clkout1 Output Clock

4.2.2 sys_clkout2 Output Clock

Table 4-12 summarizes the sys_clkout2 ouput clock electrical characteristics.

Table 4-12. sys_clkout2 Output Clock Electrical Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT
f	Frequency, sys_clkout2	sys_xtalin clock or core_dpll clock[1] or 54 MHz, 96 MHz[2]			MHz
C_L	Load capacitance	2		22	pF
Z_T	Transmission line impedance	30		70	Ω
L_T	Transmission line length	1		6	cm

(1) Possible divider: 4, 8, or 16.

(2) Possible divider: 1, 2, 4, 8, or 16.

Table 4-13 details the sys_clkout2 ouput clock switching characteristics.

Table 4-13. sys_clkout2 Output Clock Switching Characteristics[8]

NAME	DESCRIPTION		MIN	TYP	MAX	UNIT
CO0	1 / $t_{c(CLKOUT2)}$	Frequency, sys_clkout2	sys_xtalin clock or core_dpll clock[3] or 54 MHz, 96 MHz[4]			MHz
	$t_{c(xtalin)}$	Cycle time, sys_xtalin			1 / sys_xtalin (MHz)	ns
	$t_{c(coredpll)}$	Cycle time, core_dpll (DPLL3) [7]			1 / core_dpll (MHz)	ns
	$t_{c(54mhz)}$	Cycle time, 54MHz clock (DPLL4) [7]			18.52	ns
	$t_{c(96mhz)}$	Cycle time, 96MHz clock (DPLL4) [7]			10.42	ns
CO1	$t_{w(CLKOUT2)}$	Pulse duration, sys_clkout2 low or high	0.49*tc(clkout 2)		0.51*tc(clkout 2)	ns

Table 4-13. sys_clkout2 Output Clock Switching Characteristics[8] (continued)

NAME	DESCRIPTION			MIN	TYP	MAX	UNIT
	t_J[5]	Peak-to-peak jitter	Source clock: sys_xtalin			X%[6] * $t_{c(xtalin)}$ + 200	ps
			Source clock: core_dpll			4% * $t_{c(coredpll)}$ + 200	ps
			Source clock: 54MHz			4% * $t_{c(54mhz)}$ + 200	ps
			Source clock: 96MHz			4% * $t_{c(96mhz)}$ + 200	ps
	$t_{R(CLKOUT2)}$	Rise time, sys_clkout2		1.5[1]		5[2]	ns
	$t_{F(CLKOUT2)}$	Fall time, sys_clkout2		1.5[1]		5[2]	ns

(1) At minimum load

(2) At maximum load (maximum frequency 104 MHz)

(3) Possible divider: 4, 8, 16

(4) Possible divider: 1, 2, 4, 8, or 16

(5) Peak-to-peak jitter is meant here as follows:

- The maximum value is the difference between the longest measured clock period and the expected clock period
- The minimum value is the difference between the shortest measured clock period and the expected clock period

Maximum and minimum are obtained on a statistical population of 300 period samples and expressed relative to the expected clock period.

(6) Depending on the internal system clock divider configuration (PRCM.PRM_CLKSRC_CTRL[7:6], SYSCLKDIV bit field), the sys_xtalin input clock can be divided by 2 to provide the standard system clock (SYS_CLK) frequencies. For more information, see the Power, Reset, and Clock Management / PRCM Functional Description / PRCM Clock Manager Functional Description / External Clock I/Os / External Clock Inputs / High-Frequency System Clock section of *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

In X%, X represents then the internal system clock divider with following possible values: X = 1 or 2.

(7) This cycle time specified here is the clock period of the clock going out of sys_clkout2.

(8) In this table, the transition times are calculated for 10%-90% of VDDS. For more information on the corresponding VDDS power supply name, please see the Ball Characteristics table corresponding to your package. The POWER column defines the VDDS power supply for each ball.

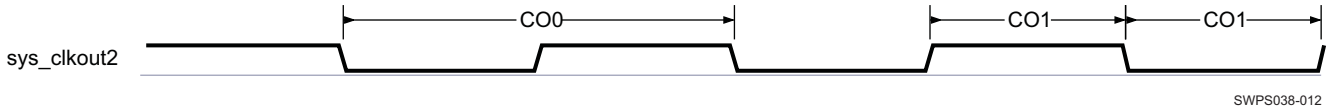

Figure 4-7. sys_clkout2 Output Clock

4.3 DPLL and DLL Specifications

NOTE

For more information, see Power, Reset, and Clock Management / PRCM Functional Description / PRCM Clock Manager Functional Description / Internal Clock Generation / DPLLs section of the *AM/DM37x Multimedia Device Technical Reference Manual* (SPRUGN4).

The applicative subsystem integrates six DPLLs and a DLL. The PRM and CM drive those listed below.

The main DPLLs are:

- DPLL1 (MPU)
- DPLL2 (IVA)
- DPLL3 (Core)
- DPLL4 (Peripherals)
- DPLL5 (Second peripherals DPLL)

4.3.1 DPLL Characteristics

Table 4-14 summarizes the DPLL characteristics and assumes testing over recommended operating conditions.

Table 4-14. DPLL1 - DPLL2 - DPLL3 - DPLL5 Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT	COMMENTS
vdda_dplls_dll	Supply voltage for DPLLs (MPU, IVA, and Core) and DLL	1.71	1.8	1.91	V	
vdda_dpll_per	Supply voltage for DPLL (Peripherals)	1.71	1.8	1.91	V	
f_{input}	CLKINP Input frequency	0.032		52	MHz	FINP
$f_{internal}$	Internal reference frequency	0.032		52	MHz	REFCLK
$f_{CLKINPHIF}$	CLKINPHIF Input frequency	10		1000	MHz	FINPHIF
$f_{CLKINPULOW}$	CLKINPULOW Input frequency	0.001		800	MHz	
f_{CLKOUT}	CLKOUT output frequency	10(1)		1000(2)	MHz	[M / (N + 1)] * FINP * [1 / M2]
$f_{CLKOUTx2}$	CLKOUTx2 output frequency	20(1)		2000(2)	MHz	2 * [M / (N + 1)] * FINP * [1 / M2]
$f_{CLKOUTHIF}$	CLKOUTHIF output frequency	10(3)		1000(4)	MHz	FINPHIF / M3
		20(3)		2000(4)		2 * [M / (N + 1)] * FINP * [1 / M3]
$f_{DCOCLKLDO}$	DCOCLKLDO output frequency	20		2000	MHz	2 * [M / (N + 1)] * FINP
t_{lock}	Frequency lock time			1.9 + 350*REFCLK	µs	
p_{lock}	Phase lock time			1.9 + 500*REFCLK	µs	
$t_{relock-L}$	Relock time—Frequency lock(5) (Low power bypass)			1.9 + 70*REFCLK	µs	DPLL in low-power mode: lowcurrstdby = 1
$p_{relock-L}$	Relock time—Phase lock(5) (Low power bypass)			1.9 + 120*REFCLK	µs	DPLL in low-power mode: lowcurrstdby = 1
$t_{relock-F}$	Relock time—Frequency lock(5) (Fast relock bypass)			0.05 + 70*REFCLK	µs	DPLL in normal mode: lowcurrstdby = 0
$p_{relock-F}$	Relock time—Phase lock(5) (Fast relock bypass)			0.05 + 120*REFCLK	µs	DPLL in normal mode: lowcurrstdby = 0

(1) The minimum frequencies on CLKOUT and CLKOUTX2 are assuming M2 = 1. For M2 > 1, the minimum frequency on these clocks will further scale down by factor of M2.

(2) The maximum frequencies on CLKOUT and CLKOUTX2 are assuming M2 = 1.

(3) The minimum frequency on CLKOUTHIF is assuming M3 = 1. For M3 > 1, the minimum frequency on this clock will further scale down by factor of M3.

(4) The maximum frequency on CLKOUTHIF is assuming M3 = 1.

(5) Relock time assumes typical operating conditions, 10°C maximum temperature drift.

Table 4-15. DPLL4 Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT	COMMENTS
vdda_dpll_per	Supply voltage for DPLL (peripherals)	1.71	1.8	1.91	V	
f_{input}	CLKINP input clock frequency	0.5		60	MHz	FINP
$f_{internal}$	REFCLK internal reference frequency	0.5		2.5	MHz	REFCLK
$f_{CLKINPULOW}$	CLKINPULOW bypass input frequency	0.001		800	MHz	
f_{CLKOUT}	CLKOUT output clock frequency	10(1)		2000(2)	MHz	[M / (N + 1)] * FINP * [1 / M2]
$f_{DCOCLKLDO}$	Internal oscillator (DCO) output clock frequency	500		2000	MHz	[M / (N + 1)] * FINP
t_{lock}	Frequency lock time			350*REFCLK	µs	
p_{lock}	Phase lock time			500*REFCLK	µs	
$t_{relock-L}$	Relock time—Frequency lock(3) (Low power bypass)			7.5 + 30*REFCLKs	µs	DPLL in low-power mode: lowcurrstdby = 1

Table 4-15. DPLL4 Characteristics (continued)

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT	COMMENTS
$p_{relock-L}$	Relock time—Phase lock[3] (Low power bypass)			7.5 + 125*REFCLKs	µs	DPLL in low-power mode: lowcurrstdby = 1
$t_{relock-F}$	Relock time—Frequency lock[3] (Fast relock bypass)			NA	µs	
$p_{relock-F}$	Relock time—Phase lock[3] (Fast relock bypass)			NA	µs	

(1) The minimum frequency on CLKOUT is assuming M2 = 1. For M2 > 1, the minimum frequency on this clock will further scale down by factor of M2.

(2) The maximum frequency on CLKOUT is assuming M2 = 1.

(3) Relock time assumes typical operating conditions, 10°C maximum temperature drift.

4.3.2 DLL Characteristics

Table 4-16 summarizes the DLL characteristics and assumes testing over recommended operating conditions.

Table 4-16. DLL Characteristics

NAME	DESCRIPTION	MIN	TYP	MAX	UNIT	COMMENTS
vdda_dplls_dll	Supply voltage for DPLLs (MPU, IVA, and Core) and DLL	1.71	1.8	1.91	V	
f_{input}	Input clock frequency [1]	66	120	200	MHz	Either application mode 0 and 1
t_{lock}	Lock time			500	Clocks	
t_{relock}	Relock time (Mode transitions through idle mode)			500	ns	IDLE to MODEMAXDELAY
			250	450	Clocks	IDLE to APPLICATION MODE 1 or 0
			1.88	3.38	µs	IDLE to APPLICATION MODE @133 MHz
			1.50	2.71	µs	IDLE to APPLICATION MODE @166 MHz
			1.25	2.25	µs	IDLE to APPLICATION MODE @200 MHz

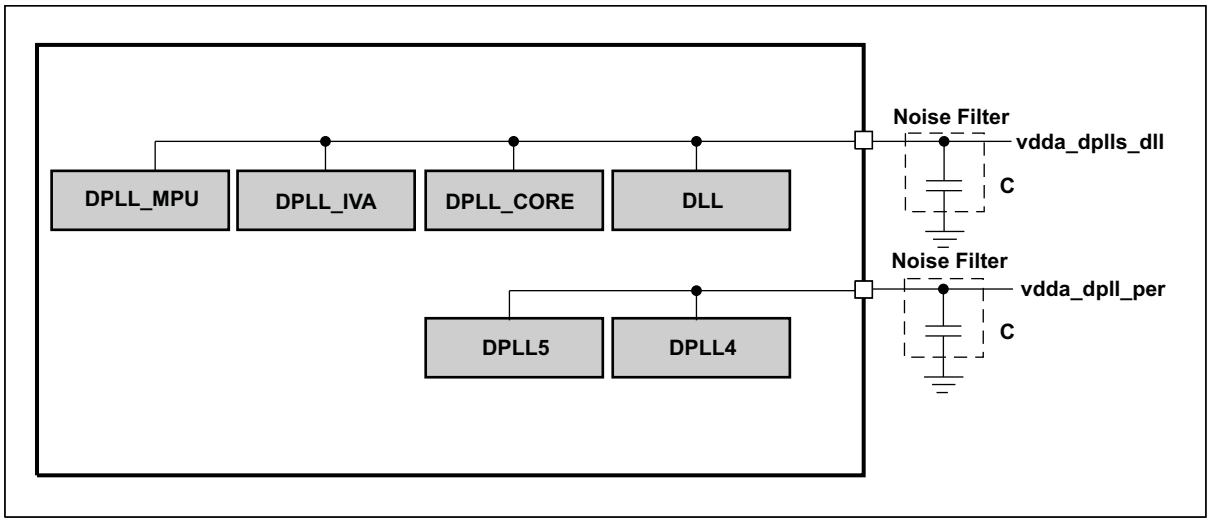
(1) Maximum frequency for nominal conditions.

4.3.3 DPLL and DLL Noise Isolation

The noise filters (decoupling capacitors) are required to suppress the switching noise generated by high frequency and to stabilize the supply voltage.

A noise filter is most effective when it is close to the device, because this minimizes the inductance of the circuit board wiring and interconnects.

Figure 4-8 illustrates an example of a noise filter.



A. This circuit is provided only as an example.
B. The filter must be located as close as possible to the device.

Figure 4-8. DPLL Noise Filter

Table 4-17 specifies the noise filter requirements.

Table 4-17. DPLL Noise Filter Requirements(1)

NAME	MIN	TYP	MAX	UNIT
Filtering capacitor	50	100	150	nF

(1) For more information, see IO and Analog Voltage Decoupling Capacitors.

4.3.4 Processor Clocks

Table 4-18 through Table 4-20 show the clocks AC performance values.

Table 4-18. Processor Voltages Without SmartReflex™

	RETENTION	OPP50			OPP100			OPP130(3)		
	MIN	MIN	TYP	MAX	MIN	TYP	MAX	MIN	TYP	MAX
VDD1(1) (2) (V)	0.8	0.92	0.97	1.02	1.08	1.14	1.2	1.21	1.27	1.33

(1) At ball level.
(2) Minimum OPP voltage values defined in this table include any voltage transient.
(3) OPP130 is not available above T_J of 90C.

Table 4-19. Processor Voltages With SmartReflex™

	RETENTION	OPP50			OPP100			OPP130(4)			OPP1G (4) (5)(6)		
	MIN	MIN	TYP	MAX	MIN	TYP	MAX	MIN	TYP	MAX	MIN	TYP	MAX

Table 4-19. Processor Voltages With SmartReflex™ (continued)

	RETENTION	OPP50			OPP100			OPP130[4]			OPP1G [4] [5][6]		
VDD1[1] [2] [3] (V)	0.8	0.92	0.97	1.02	1.08	1.14	1.2	1.21	1.27	1.33	1.28	1.33	1.38

(1) At ball level.

(2) These VDD1 (vdd_mpu_iva) values are the required voltage ranges prior to enabling the SmartReflex AVS feature. After calibration, the minimum voltage may be lower than this specification.

(3) Minimum OPP voltage values defined in this table include any voltage transient.

(4) OPP130 and OPP1G are not available above T_J of 90C.

(5) OPP1G is a high performance operating point which has following requirements:

- ABB LDO must be set to FBB (Forward Body Bias) mode when switching to this OPP. It requires having a 1µF capacitor connected to cap_vdd_bb_mpu_iva.
- AVS (Adaptive Voltage Scaling) power technique must be used to achieve optimum operating voltage.

(6) Based on DM3730 PCB constraints, the vdd_mpu_iva (VDD1) voltage value calibrated before enabling SmartReflex™ is recommended to be 1.38V. Minimum (1.28V) and typical (1.33V) values provided can be achieved only with very good power delivery network design. For more information on vdd_mpu_iva power delivery network design requirements, see the PCB Design Requirements for VDD_MPU_IVA Power Distribution Network for TI OMAP3630, AM37xx, and DM37xx Microprocessors (SPRABJ7) application note.

Table 4-20. Processor Clocks

		OPP50		OPP100		OPP130		OPP1G [2]	
Description	Source Clock	Max Freq.(MHz)	Ratio	Max Freq.(MHz)	Ratio	Max Freq.(MHz)	Ratio	Max Freq.(MHz)	Ratio
DPLL1 Locked Frequency	-	1200	-	1200	-	1600	-	2000	-
DPLL1CLKOUT_M2	DPLL1 Locked Frequency	300	2 *(M2 = 2)[1][4]	600	2 *(M2 = 1)[1][4]	800	2 *(M2 = 1)[1][4]	1000	2 *(M2 = 1)[1][4]
DPLL2 Locked Frequency	-	1040	-	1040	-	1320	-	1600	-
DPLL2CLKOUT_M2	DPLL2 Locked Frequency	260	2 *(M2 = 2)[1][4]	520	2 *(M2 = 2)[1][4]	660	2 *(M2 = 2)[1][4]	800	2 *(M2 = 2)[1][4]
ARM_FCLK	DPLL1CLKOUT_M2	300	1	600	1	800	1	1000	1
IVA_CLK	DPLL2CLKOUT_M2	260	1	520	1	660	1	800	1

(1) This ratio is configurable by software programming. For more information, see the *AM/DM37x Multimedia Device Technical Reference Manual* (SPRUGN4).

(2) OPP1G is a high performance operating point which has following requirements:

- ABB LDO must be set to FBB (Forward Body Bias) mode when switching to this OPP. It requires having a 1µF capacitor connected to cap_vdd_bb_mpu_iva.
- AVS (Adaptive Voltage Scaling) power technique must be used to achieve optimum operating voltage.

(3) For more information about ARM_FCLK and IVA2_CLK processor clocks configuration, see the Power, Reset, and Clock Management / PRCM Functional Description / PRCM Clock Manager Functional Description / Clock Configurations / Processor Clock Configurations section or the MPU Subsystem / MPU Subsystem Integration / MPU Subsystem Clock and Reset Distribution / Clock Distribution section of the *AM/DM37x Multimedia Device Technical Reference Manual* (SPRUGN4).

(4) The DPLL ratios documented in this table are recommended ratios. Other values may apply.

4.3.5 Device Core Clocks

Table 4-21 and Table 4-22 show the device core clocks AC performance values.

Table 4-21. Device Core Voltages

	RETENTION	OPP50			OPP100		
	MIN	MIN	TYP	MAX	MIN	TYP	MAX
VDD2 (1) (2) (3) (V)	0.8	0.90	0.95	1.00	1.08	1.14	1.20

(1) At ball level.

(2) Minimum OPP voltage values defined in this table include any voltage transient.

(3) When SmartReflex™ is not used, these values define the required voltage range. When SmartReflex™ will be used, these voltages are the required voltage range prior to enabling the SmartReflex™ feature. After calibration, the minimum voltage may be lower than this specification.

Table 4-22. Device Core Clocks

		OPP50						OPP100					
Description	Source	Max Freq.(MHz)	Ratio	Max Freq.(MHz)	Ratio	Max Freq.(MHz)	Ratio	Max Freq.(MHz)	Ratio	Max Freq.(MHz)	Ratio	Max Freq.(MHz)	Ratio
DPLL3 Locked Frequency	-	800	-	664	-	400	-	800	-	664	-	532	-
DPLL3CLKOUT_M2	DPLL3 Locked Frequency	200	2 *(M2 = 2)(1)(2)	166	2 *(M2 = 1)(1)(2)	200	2 *(M2 = 1)(1)(2)	400	2 *(M2 = 1)(1)(2)	332	2 *(M2 = 1)(1)(2)	266	2 *(M2 = 1)(1)(2)
CORE_CLK	DPLL3CLKOUT_M2	200	1	166	1	200	1	400	1	332	1	266	1
L3_ICLK	CORE_CLK	100	2(1)	83	2(1)	100	2(1)	200	2(1)	166	2(1)	133	2(1)
L4_ICLK	L3_ICLK	50	2(1)	41.5	2(1)	50	2(1)	100	2(1)	83	2(1)	66.5	2(1)
SDRC_CLK	L3_ICLK	100	1	83	1	100	1	200	1	166	1	133	1
GPMC_CLK	L3_ICLK	50	2(1)	41.5	2(1)	50	2(1)	100	2(1)	83	2(1)	66.5	2(1)

(1) This ratio is configurable by software programming. For more information, see the *AM/DM37x Multimedia Device Technical Reference Manual* (SPRUGN4).

(2) The DPLL ratios documented in this table are recommended ratios. Other values may apply.

4.3.6 Graphic Accelerator (SGX) Clocks

Table 4-23 and Table 4-24 show the recommended V_{DD2} (corresponding to vdd_core, Core and SGX voltage at ball level) voltages ranges and the standard graphic accelerator (SGX) clocks speed characteristics vs V_{DD2}.

Table 4-23. Graphic Accelerator Voltages

	OPP 100 (2)		
	MIN	TYPICAL	MAX
V_{DD2}(1)(3)(4) (V)	1.08	1.14	1.20

(1) At ball level.

(2) SGX (Graphic Accelerator) is not available in the OPP50 operating point.

(3) When SmartReflex™ is not used, these values define the required voltage range. When SmartReflex™ will be used, these voltages are the required voltage range prior to enabling the SmartReflex™ feature. After calibration, the minimum voltage may be lower than this specification.

(4) Minimum OPP voltage values defined in this table include any voltage transient.

Table 4-24. Graphic Accelerator Clocks[2]

		OPP 100[2]					
Description	**Source Clock**	**Max Freq (MHz)**	**Ratio**	**Max Freq (MHz)**	**Ratio**	**Max Freq (MHz)**	**Ratio**
DPLL3 Locked Frequency		800		664		532	
DPLL4 Locked Frequency		1728		1728		1728	
DPLL3CLKOUTX2_M2	DPLL3 Locked Frequency	800	1 * (M2 = 1)[1][3]	664	1 * (M2 = 1)[1][3]	532	1 * (M2 = 1)[1][3]
DPLL3CLKOUT_M2	DPLL3 Locked Frequency	400	2 * (M2 = 1)[1][3]	332	2 * (M2 = 1)[1][3]	266	2 * (M2 = 1)[1][3]
DPLL4CLKOUT_M2	DPLL4 Locked Frequency	192	1 * (M2 = 9)[1][3]	192	1 * (M2 = 9)[1][3]	192	1 * (M2 = 9)[1][3]
CORE_CLK	DPLL4 Locked Frequency	400	1	332	1	266	1
COREX2_CLK	DPLL3CLKOUTX2_M2	800	1	664	1	532	1
SGX_192M_FCLK	DPLL4CLKOUT_M2	192	1	192	1	192	1
SGX – Option 1	CORE_CLK	200	2	166	2	133	2
SGX – Option 2	COREX2_CLK					177.3	3
SGX – Option 3	SGX_192M_FCLK	192	1	192	1	192	1

(1) This ratio is configurable by software programming. For more information, see the *AM/DM37x Multimedia Device Technical Reference Manual* (SPRUGN4).

(2) SGX (Graphic Accelerator) is not available in OPP50 operating point.

(3) The DPLL ratios documented in this table are recommended ratios. Other values may apply.

5 Video DAC Specifications

NOTE

For more information regarding the VideoDAC architecture, see the Display Subsystem / Display Subsystem Functional Description / Video Encoder Functionalities / Video DAC Stage—Architecture and Control section of *AM/DM37x Technical Reference Manual* (literature number SPRUGN4).

5.1 TVOUT Buffer Mode (DAC + Buffer)

NOTE

AVDAC normal mode (DAC + Buffer), higher values of the DAC input code provided by the Video Encoder will result in lower output voltage due to the inverting configuration of the TVOUT Buffer. See Figure 5-4 for more details on the relation between the composite video signal levels and the DAC code values for normal mode of operation.

In AVDAC bypass mode (DAC only), higher values of the DAC input code will result in higher output voltage, as the TVOUT Buffer path is bypassed.

The connection for this TVOUT buffer mode (DAC + Buffer) normal mode of operation is shown in Figure 5-1. The default mode of operation is dc coupling. For more information regarding the recommended values of the external components, see Section 5.4, *Electrical Specifications Over Recommended Operating Conditions*.

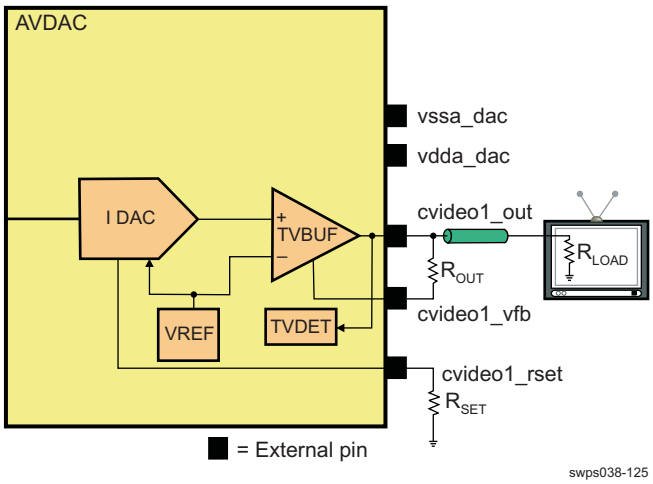


Figure 5-1. Recommended Loading Conditions for TVOUT Buffer Mode(1)

(1) In single-channel configuration only channel-1 is used.

5.2 TVOUT Bypass Mode (DAC Only)

In this case, TVOUT bypass input is high and the TVOUT buffer is bypassed (for more information, see Section 5.5, *TVOUT Bypass Mode Specifications (DAC-Only) Electrical Specifications Over Recommended Operating Conditions*). Figure 5-2 shows the connection. For more information regarding the recommended values of the external components, see Section 5.4, *Electrical Specifications Over Recommended Operating Conditions*.

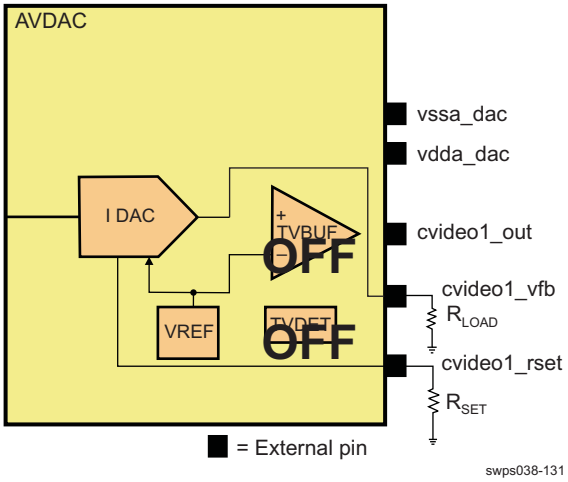

Figure 5-2. Recommended Loading Conditions for TVOUT Bypass Mode(1)

(1) In single-channel configuration only channel-1 is used.

5.3 TVOUT Bypass Mode in Dual-Channel Configuration

In this case, TVOUT bypass input is high and the TVOUT buffer is bypassed (for more information, see Section 5.5, *TVOUT Bypass Mode Specifications (DAC-Only) Electrical Specifications Over Recommended Operating Conditions*). Figure 5-3 shows the connection. For more information regarding the recommended values of the external components, see Section 5.4, *Electrical Specifications Over Recommended Operating Conditions*.

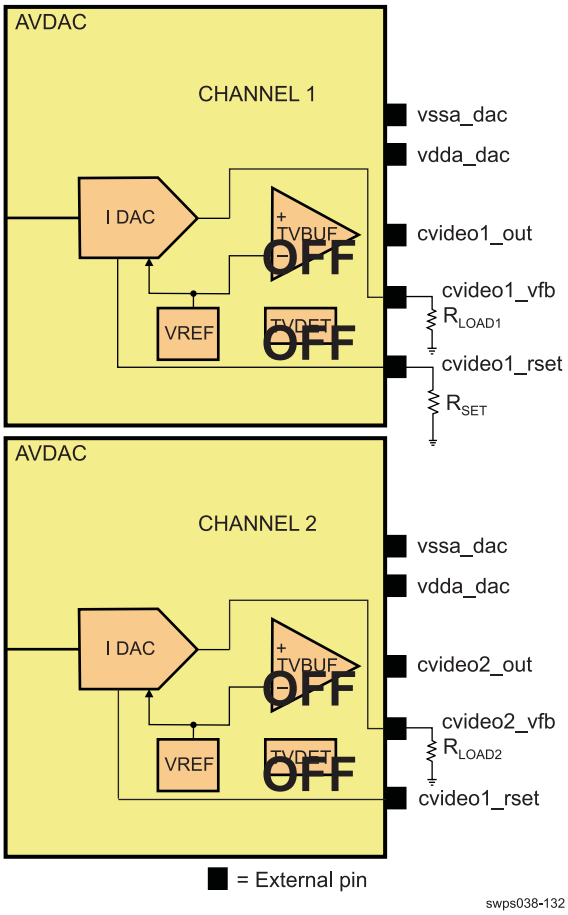

Figure 5-3. Recommended Loading Conditions for TVOUT Bypass Mode in Dual-Channel Configuration(1)

(1) Here are some connections recommendations:

- An external resistor R_{SET} = 10 kΩ (±1%) is recommended to be connected to the cvideo1_rset signal of Channel 1.
- The cvideo1_rset signal of Channel 2 is left unconnected.
- External resistors $R_{LOAD1LOAD2}$ = 1.5 kΩ (±1%) is recommended to be connected to cvideo1_vfb or cvideo2_vfb each channel.

5.4 Electrical Specifications Over Recommended Operating Conditions

NOTE

High-swing mode is the default mode. The low-swing mode is not compliant with the NTSC and PAL video-standards. It shall be used only for backwards compatibility to AM/DM37x.

- TVOUT DC High Swing Mode:
  - $R_{OUT1/2}$ = 2.7 kΩ (±1%)
  - R_{SET} = 4.7 kΩ (±1%)
  - R_{LOAD} = 75 Ω (±5%)
  - Z_{CABLE} = 75 Ω (±5%)
- TVOUT DC Low Swing Mode:
  - $R_{OUT1/2}$ = 2.7 kΩ (±1%)
  - R_{SET} = 6.8 kΩ (±1%)
  - R_{LOAD} = 75 Ω (±5%)
  - Z_{CABLE} = 75 Ω (±5%)
- TVOUT AC High Swing Mode:
  - $R_{OUT1/2}$ = 2.7 kΩ (±1%)
  - R_{SET} = 4.7 kΩ (±1%)
  - R_{LOAD} = 75 Ω (±5%)
  - Z_{CABLE} = 75 Ω (±5%)
  - C_{AC} = 220 µF (±5%)
- TVOUT AC Low Swing Mode:
  - $R_{OUT1/2}$ = 2.7 kΩ (±1%)
  - R_{SET} = 6.8 kΩ (±1%)
  - R_{LOAD} = 75 Ω (±5%)
  - Z_{CABLE} = 75 Ω (±5%)
  - C_{AC} = 220 µF (±5%)

Table 5-1. DAC – Static Electrical Specifications[8]

PARAMETER		CONDITIONS/ASSUMPTIONS		MIN	TYP	MAX	UNIT
R	Resolution				10		Bits
DC ACCURACY							
INL[1]	Integral Non-Linearity (INL)	50 to 111 input code range		–6		6	LSB
	Integral Non-Linearity (INL) Signal video range	111 to 895 input code range		–4		4	
	Integral Non-Linearity (INL) Synchronization pulse	783 to 1007 input code range		–5		5	
DNL[2]	Differential nonlinearity	111 to 895 input code range		–2.5		2.5	LSB
ANALOG OUTPUT							
-	Output voltage	0 to 1023 input code range, R_{LOAD} = 75 Ω	Low-swing mode	0.70	0.88	1.00	V
			High-swing mode	1.2	1.3	1.5	
-	Gain error	-	Low-swing mode	–20		20	% FS
			High-swing mode	–10		10	
R_{VOUT}	Output impedance			67.5	75.0	82.5	Ω
REFERENCE							
V_{REF}	Internal Band Gap Voltage Reference				0.55		V

Table 5-1. DAC – Static Electrical Specifications[8] (continued)

PARAMETER			CONDITIONS/ASSUMPTIONS		MIN	TYP	MAX	UNIT
POWER CONSUMPTION								
$I_{vdda-up}$	Analog Supply Current[4]	DC mode No load	Average current on vdda_dac, no load, 2 channels Input code 50 (maximum output voltage)		4.5	6.5	8.5	mA
		AC mode No load			19	28	37	
		Full load 75-Ω load			19	28	37	
$I_{vdda-up}$ (peak)	Peak analog supply current		Lasts less than 1 ns			60		mA
I_{vdd-up}	Digital supply current[5]		Average current, measured at f_{CLK} = 54 MHz, f_{OUT} = 2 MHz sine wave, vdd = 1.1 V				2	mA
I_{vdd-up} (peak)	Peak digital supply current[6]		Peak current, full-scale transition lasting less than 1 ns			8		mA
$I_{vdda-down}$[9]	Analog supply current, total power down[9]		T = 30°C, vdda_dac = 1.8 V, no load				12	µA
$I_{vdda-stdby}$[9]	Analog supply current, standby mode[9]		Bandgap and internal LDO are ON, all other analog blocks are OFF, no load, T = 30 C°		90	180	270	µA
$I_{vdd-down(pm)}$[9]	Digital supply current, total power down[9]		T = 30°C, Full or Partial Power Management	Low-swing mode			2	µA
				High-swing mode			6	
$I_{vdd-down(nopm)}$	Digital supply current, total power down (no power management)		T = 30°C, VDD = 1.1 V, no Power Management				60	µA

(1) The INL is measured at the output of the DAC (accessible at an external pin during bypass mode). The INL at code 783 equals 0.

(2) The DNL is measured at the output of the DAC (accessible at an external pin during bypass mode). The INL at code 783 equals 0.

(3) Reference PSR measures the effect of a supply disturbance at cvideo1_out and cvideo2_out.

(4) The analog supply current I_{vdda} is directly proportional to the full-scale output current IFS and is insensitive to f_{CLK}.

(5) The digital supply current I_{VDD} is dependent on the digital input waveform, the DAC update rate f_{CLK}, and the digital supply VDD.

(6) The peak digital supply current occurs at full-scale transition for duration less than 1 ns.

(7) See Section 5.6, *Analog Supply (vdda_dac) Noise Requirements*, for actual maximum ripple allowed on vdda_dac.

(8) For more information on code range definition, see Figure 5-4.

(9) For more information on AVDAC power-up, power-down, and standby mode configurations, see Display Subsystem / Display Subsystem Functional Description / Video Encoder Functionalities / Video DAC Stage Power Management section of *AM/DM37x Technical Reference Manual* (literature number SPRUGN4).

NOTE

High-swing mode is the default mode. The low-swing mode is not compliant with the NTSC and PAL video-standards. It is used only for backwards compatibility to AM/DM37x.

Table 5-2. Video DAC – Dynamic Electrical Specifications(6)

PARAMETER	CONDITIONS/ASSUMPTIONS			MIN	TYP	MAX	UNIT
f_{CLK}(1)	Output update rate	Equal to input clock frequency			54	60	MHz
	Clock jitter	RMS clock jitter required in order to assure 10-bit accuracy			40	70	ps
	Attenuation at 5.1 MHz	Corner frequency for signal	DC mode			1.5	dB
			AC mode				
BW	Signal bandwidth	3 dB	DC mode		6		MHz
			AC mode				
	Differential gain(2)	111 to 895 input code range	DC mode	–5%		5%	
			AC mode	–5%		5%	
	Differential phase(2)	111 to 895 input code range	DC mode	–3°		3°	
			AC mode	–3°		3°	
SFDR	Within bandwidth 1 kHz to 6 MHz	f_{CLK} = 54 MHz, f_{OUT} = 1 MHz, sine wane input, 111 to 895 input code range	DC mode	40	50	70	dB
			AC mode				
SNR	Within bandwidth 1 kHz to 6 MHz	f_{CLK} = 54 MHz, f_{OUT} = 1 MHz, sine wane input, 256 to 768 input code range	DC mode	50	54	75	dB
			AC mode				
PSR(4)	Power supply rejection (up to 6 MHz)	100 mVpp at 6 MHz, input code 895			6(4)		dB
Crosstalk	Between the two video channels				–50	–40	dB
C_{Load}	TVOUT (cvideo_out1 and cvideo_out2) stability, TVOUT decoupling capacity	Total decoupling capacity from cvideo_out1 or cvideo_out2 to ground, C_{Load1}				300	pF
C_{TOT}	TVOUT stability, total TVOUT decoupling capacity	Total decoupling capacity: $C_{TOT} = C_{Load1} + C_{Load2}$				600	pF

(1) For internal input clock information, see the DSS chapter of *AM/DM37x Technical Reference Manual* (literature number SPRUGN4).

(2) The differential gain and phase value is for dc coupling. Note that there is degradation for the ac coupling. The Differential Gain and Phase are measured with respect to the gain and phase of the burst signal (–20 to 20 IRE)

(3) The SNR value is for dc coupling.

(4) PSR measures the effect of a supply disturbance at cvideo1_out and cvideo2_out.

(5) The flat band measurement is done at 500 kHz for characterizing the attenuation at 5.1 MHz.

(6) For more information on code range definition, see Figure 5-4.

Figure 5-4 describes the composite video signal levels.

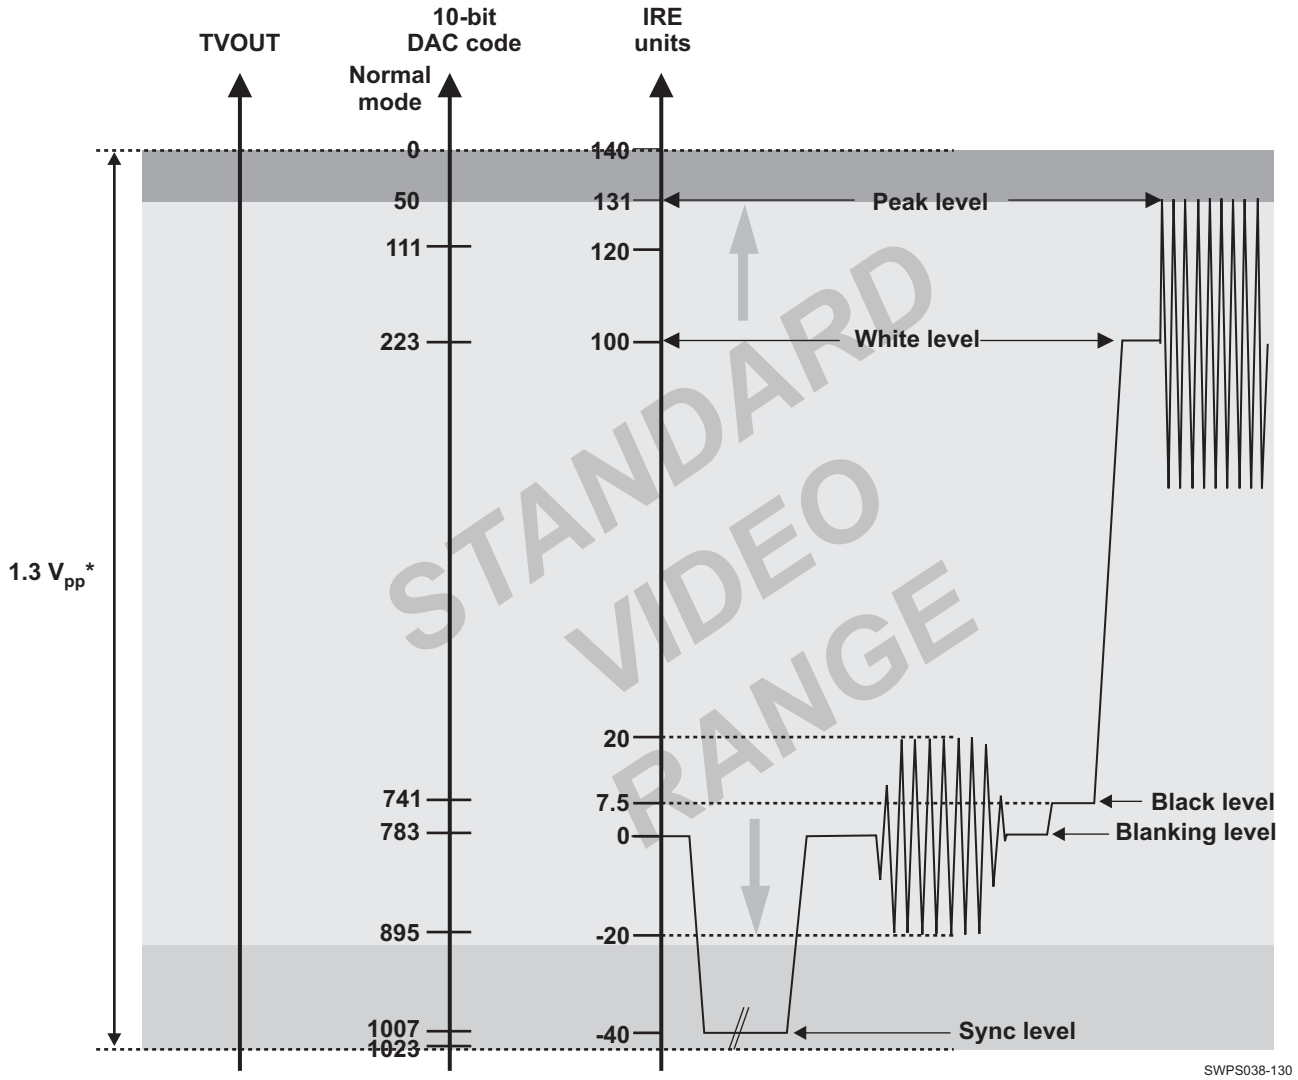

Figure 5-4. Composite Video Signal Levels(1)(2)

(1) The 1.3 V_{PP} (peak-to-peak) is referring to the output signal at cvideo1_out in the DAC + Buffer composite-video mode.
Note that the 1.3 V_{PP} must apply to both cvideo1_out and cvideo2_out in DAC + Buffer s-video mode (dual-DAC mode configured for ac or dc coupling).

(2) In AVDAC normal mode (DAC + Buffer), higher values of the DAC input code provided by the Video Encoder will result in lower output voltage due to the inverting configuration of the TVOUT Buffer. See Figure 5-4 for more details on the relation between the composite video signal levels and the DAC code values for normal mode of operation.
In AVDAC bypass mode (DAC only), higher values of the DAC input code will result in higher output voltage, as the TVOUTBuffer path is bypassed.

5.5 TVOUT Bypass Mode Specifications (DAC-Only) Electrical Specifications Over Recommended Operating Conditions

NOTE

The electrical characteristics for single- and dual-channel bypass modes are the same except that the active current will double in the dual-channel configuration.

- Bypass Mode
  - R_{LOAD} = 1.5 kΩ (±1%)
  - R_{SET} = 10 kΩ (±1%)

Table 5-3. DAC—Static Electrical Specifications—Bypass Mode(2)

PARAMETER		CONDITIONS/ASSUMPTIONS	MIN	TYP	MAX	UNIT
R	Resolution			10		Bits
DC ACCURACY						
INL(1)	Integral nonlinearity (INL)	37 to 954 input code range, R_{LOAD} = 1.5 kΩ	–1		1	LSB
DNL(1)	Differential nonlinearity	37 to 954 input code range, R_{LOAD} = 1.5 kΩ	–1		1	LSB
ANALOG OUTPUT						
-	Output voltage	R_{LOAD} = 1.5 kΩ	0.6	0.7	0.77	V
-	Output current	R_{LOAD} = 1.5 kΩ	0.6	0.7	0.77	V
-	Gain error	-	–10		10	% FS
POWER CONSUMPTION						
$I_{vdda-up}$	Analog supply current	Average current on vdda_dac, R_{LOAD} = 1.5 kΩ Input code 1023	0.7	1.0	1.4	mA
$I_{vdda-down}$	Analog supply current, total power down	T = 30C°, vdda_dac = 1.8 V, no load			12	µA
$I_{vdda-stdby}$	Analog supply current, standby mode	Bandgap and internal LDO are ON, all other analog blocks are OFF, no load, T = 30C°	90	180	270	µA

(1) In bypass mode, output node is cvideo1_out and cvideo2_out nodes. For more information, see Section 5.2, *TVOUT Bypass Mode (DAC Only)* or Section 5.3, *TVOUT Bypass Mode in Dual-Channel Configuration*.

(2) For more information on code range definition, see Figure 5-4.

Table 5-4. Video DAC—Dynamic Electrical Specifications—Bypass Mode

PARAMETER		CONDITIONS/ASSUMPTIONS	MIN	TYP	MAX	UNIT
f_{CLK}	Output update rate	Equal to input clock frequency		54	60	MHz
	Clock jitter	RMS clock jitter required in order to assure 10-bit accuracy		40	70	ps
BW	Signal bandwidth	3dB		6		MHz
SFDR	Within bandwidth 1 kHz to 6 MHz	f_{CLK} = 54 MHz, f_{OUT} = 1 MHz, sine wave input, 111 to 895 input code range	40	50	70	dB
SNR	Within bandwidth 1 kHz to 6 MHz	f_{CLK} = 54 MHz, f_{OUT} = 1 MHz, sine wave input, 256 to 768 input code range	50	54	75	dB
PSR	Power supply rejection (up to 6 MHz)	100 mVpp at 6 MHz, input code 895		6(1)		dB

(1) For more information on code range definition, see Figure 5-4.

5.6 Analog Supply (vdda_dac) Noise Requirements

In order to assure 10-bit accuracy of the DAC analog output, the analog supply vdda_dac has to meet the noise requirements stated in this section.

The DAC Power Supply Rejection Ratio (PSRR) is defined as the relative variation of the full-scale output current divided by the supply variation. Thus, it is expressed in percentage of Full-Scale Range (FSR) per volt of supply variation as shown in the following equation:

$$PSRR_{DAC} = \frac{100 \cdot \frac{\Delta I_{OUT}}{I_{OUTFS}}}{V_{AC}} \qquad \left[\frac{\%\ FSR}{V}\right]$$

swps038-e001

Depending on frequency, the PSRR is defined in Table 5-5.

Table 5-5. Video DAC – Power Supply Rejection Ratio

Supply Noise Frequency	PSRR % FSR/V
0 to 100 kHz	1
> 100 kHz	The rejection decreases 20 dB/dec. Example: at 1 MHz the PSRR is 10% of FSR/V.

A graphic representation is shown in Figure 5-5.

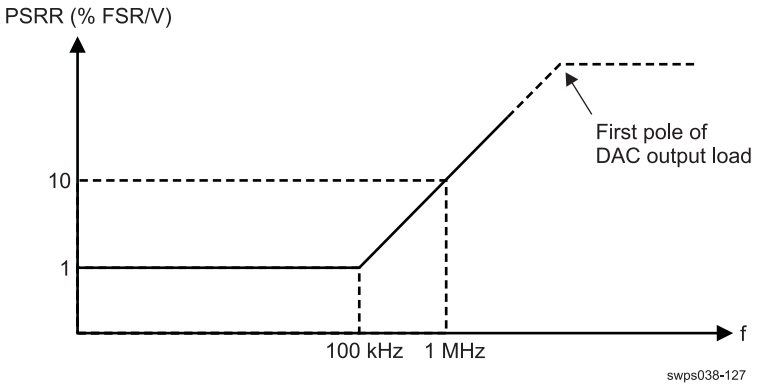

Figure 5-5. Video DAC – Power Supply Rejection Ratio

To ensure that the DAC SFDR specification is met, the PSRR values and the clock jitter requirements translate to the following limits on vdda_dac (for the Video DAC).

The maximum peak-to-peak noise on vdda (ripple) is defined in Table 5-6.

Table 5-6. Video DAC – Maximum Peak-to-Peak Noise on vdda_dac

Tone Frequency	Maximum Peak-to-Peak Noise on vdda_dac
0 to 100 kHz	< 30 mV_{PP}
> 100 kHz	Decreases 20 dB/dec. Example: at 1 MHz the maximum is 3 mV_{PP}

The maximum noise spectral density (white noise) is defined in Table 5-7.

Table 5-7. Video DAC – Maximum Noise Spectral Density

Supply Noise Bandwidth	Maximum Supply Noise Density
0 to 100 kHz	< 20 µV / √Hz
> 100 kHz	Decreases 20 dB/dec. Example: at 1 MHz the maximum noise density is 2 µV / √Hz

Because the DAC PSRR deteriorates at a rate of 20 dB/dec after 100 kHz, it is highly recommended to have vdda_dac low pass filtered (proper decoupling) (see the illustrated application: Section 5.7, *External Component Value Choice*).

5.7 External Component Value Choice

The output current I_{DACOUT} appearing at the output of the 10-bit DAC is a function of both the input code DAC_CODE (ranging from 0 to 1023) and I_{DACMAX} and can be expressed as:

$I_{DACOUT} = I_{REF} * (DAC\_CODE / 120)$ (1)

The maximum output current I_{DACMAX} from the DAC is given by:

$I_{DACMAX} = I_{REF} * 1023 / 120$ (2)

The reference current, I_{REF}, is set by a combination of internal and external resistors in series, R_{REF}, and an internal reference voltage, V_{REF}, and is given by:

$I_{REF} = V_{REF} / R_{REF}$ (3)

Typically, V_{REF} = 0.55 V and R_{REF} = 9.4 kΩ in TVOUT High-Swing mode.

The video signal voltage at cvideo_out1 and cvideo_out2 nodes can be written as (excluding the offset voltage):

$V_{TVOUT} = 35 * R_{LOAD} * I_{DACMAX} * (1 – DAC\_CODE / 1023)$ (4)

Figure 5-6 shows the cvideo_out1 and cvideo_out2 transfer function. Regarding the typical composite video signal levels versus the DAC input code, for more information on code range definition, see Figure 5-4.

Regarding the typical values of the typical values for $R_{out1/2}$ and R_{set} resistors, as well for C_{out} capacitor, for different modes of the TV display interface, see the Display Subsystem / Display Subsystem Environment / TV Display Support section of *AM/DM37x Technical Reference Manual* (literature number SPRUGN4).

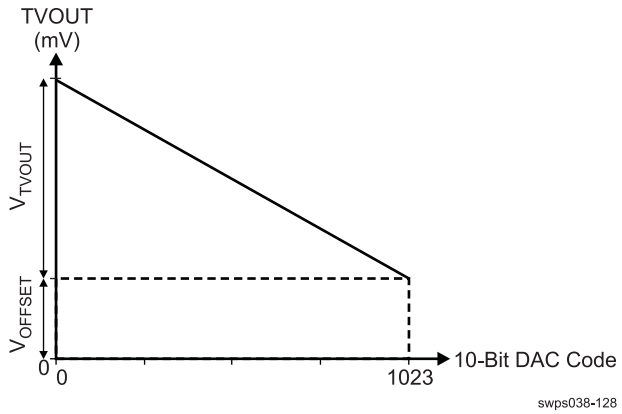

Figure 5-6. cvideo_out1 and cvideo_ou2 Transfer Function

NOTE

The dc levels (Voffset) will be shifted due to process variations.

6 Timing Requirements and Switching Characteristics

6.1 Timing Test Conditions

All timing requirements and switching characteristics are valid over the recommended operating conditions unless otherwise specified.

6.2 Interface Clock Specifications

6.2.1 Interface Clock Terminology

The interface clock is used at the system level to sequence the data and/or to control transfers accordingly with the interface protocol.

6.2.2 Interface Clock Frequency

The two interface clock characteristics are:

- The maximum clock frequency
- The maximum operating frequency

The interface clock frequency documented in this document is the maximum clock frequency, which corresponds to the maximum frequency programmable on this output clock. This frequency defines the maximum limit supported by the device IC and doesn't take into account any system consideration (PCB, Peripherals).

The system designer will have to consider these system considerations and the device IC timing characteristics as well, to define properly the maximum operating frequency, which corresponds to the maximum frequency supported to transfer the data on this interface.

6.2.3 Clock Jitter Specifications

Jitter is a phase noise, which may alter different characteristics of a clock signal. The jitter specified in this document is the time difference between the typical cycle period and the actual cycle period affected by noise sources on the clock. The cycle (or period) jitter terminology will be used to identify this type of jitter.

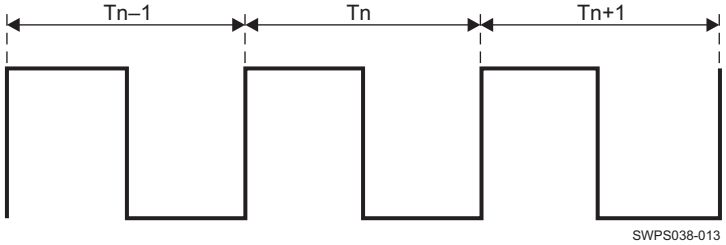

Figure 6-1. Cycle (or Period) Jitter

NOTE

Max. Cycle Jitter = Max (Ti)

Min. Cycle Jitter = Min (Ti)

Jitter Standard Deviation (or RMS Jitter) = Standard Deviation (Ti)

6.2.4 Clock Duty Cycle Error

The maximum duty cycle error is the difference between the absolute value of the maximum high-level pulse duration or the maximum low-level pulse duration and the typical pulse duration value.

- Maximum pulse duration = Typical pulse duration + maximum duty cycle error
- Minimum pulse duration = Typical pulse duration - maximum duty cycle error

6.3 Timing Parameters

The timing parameter symbols used in the timing requirements and switching characteristics tables are created in accordance with JEDEC Standard 100. To shorten the symbols, some of pin names and other related terminologies have been abbreviated as follows:

Table 6-1. Timing Parameters

SUBSCRIPTS	
SYMBOL	**PARAMETER**
c	Cycle time (period)
d	Delay time
dis	Disable time
en	Enable time
h	Hold time
su	Setup time
START	Start bit
t	Transition time
v	Valid time
w	Pulse duration (width)
X	Unknown, changing, or don't care level
F	Fall time
H	High
L	Low
R	Rise time
V	Valid
IV	Invalid
AE	Active edge
FE	First edge
LE	Last edge
Z	High impedance

6.4 External Memory Interfaces

The device includes the following external memory interfaces:

- General-purpose memory controller (GPMC)
- SDRAM controller (SDRC)

6.4.1 General-Purpose Memory Controller (GPMC)

NOTE

For more information, see Memory Subsystem / General-Purpose Memory Controller section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

The GPMC is the unified memory controller used to interface external memory devices such as:

- Asynchronous SRAM-like memories and ASIC devices
- Asynchronous page mode and synchronous burst NOR flash
- NAND flash

6.4.1.1 GPMC/NOR Flash—Synchronous Mode

Table 6-3 and Table 6-4 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-2 through Figure 6-6).

Table 6-2. GPMC/NOR Flash Timing Conditions—Synchronous Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	1.8	ns
t_F	Input signal fall time	1.8	ns
Output Conditions			
C_{LOAD}	Output load capacitance(1)	12	pF

(1) The load setting of the IO buffer: LB0 = 1.

Table 6-3. GPMC/NOR Flash Timing Requirements—Synchronous Mode(1)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
F12	$t_{su(dV-clkH)}$	Setup time, input data gpmc_d[15:0] valid before output clock gpmc_clk high	2.3		2.3		ns
F13	$t_{h(clkH-dV)}$	Hold time, input data gpmc_d[15:0] valid after output clock gpmc_clk high	1.5		1.5		ns
F21	$t_{su(waitV-clkH)}$	Setup time, input wait gpmc_waitx(2) valid before output clock gpmc_clk high	2.3		2.3		ns
F22	$t_{h(clkH-waitV)}$	Hold time, input wait gpmc_waitx(2) valid after output clock gpmc_clk high	1.9		1.9		ns

(1) See Section 4.3.4, *Processor Clocks*.

(2) In gpmc_waitx, x is equal to 0, 1, 2, or 3.

Table 6-4. GPMC/NOR Flash Switching Characteristics—Synchronous Mode(2) (18)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
F0	$1 / t_{c(clk)}$	Frequency(15), output clock gpmc_clk		100		100	MHz
F1	$t_{w(clkH)}$	Typical pulse duration, output clock gpmc_clk high	0.5P(12)		0.5P(12)		ns
F1	$t_{w(clkL)}$	Typical pulse duration, output clock gpmc_clk low	0.5P(12)		0.5P(12)		ns

Table 6-4. GPMC/NOR Flash Switching Characteristics—Synchronous Mode[2] [18] (continued)

NO.	PARAMETER			OPP100		OPP50		UNIT
				MIN	MAX	MIN	MAX	
	$t_{dc(clk)}$	Duty cycle error, output clock gpmc_clk		–500	500	–500	500	ps
	$t_{J(clk)}$	Jitter standard deviation[16], output clock gpmc_clk			33.33		33.33	ps
	$t_{R(clk)}$	Rise time, output clock gpmc_clk			1.6		1.6	ns
	$t_{F(clk)}$	Fall time, output clock gpmc_clk			1.6		1.6	ns

(1) For single read: A = (CSRdOffTime – CSOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]
For burst read: A = (CSRdOffTime – CSOnTime + (n – 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]
For burst write: A = (CSWrOffTime – CSOnTime + (n – 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]
With n being the page burst access number.

(2) B = ClkActivationTime * GPMC_FCLK[14]

(3) For single read: C = RdCycleTime * (TimeParaGranularity + 1) * GPMC_FCLK [14]
For burst read: C = (RdCycleTime + (n – 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]
For burst write: C = (WrCycleTime + (n – 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]
With n being the page burst access number.

(4) For single read: D = (RdCycleTime – AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]
For burst read: D = (RdCycleTime – AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]
For burst write: D = (WrCycleTime – AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]

(5) For single read: E = (CSRdOffTime – AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]
For burst read: E = (CSRdOffTime – AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]
For burst write: E = (CSWrOffTime – AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]

(6) For nCS falling edge (CS activated):
- Case GpmcFCLKDivider = 0:
  - F = 0.5 * CSExtraDelay * GPMC_FCLK[14]
- Case GpmcFCLKDivider = 1:
  - F = 0.5 * CSExtraDelay * GPMC_FCLK[14] if (ClkActivationTime and CSOnTime are odd) or (ClkActivationTime and CSOnTime are even)
  - F = (1 + 0.5 * CSExtraDelay) * GPMC_FCLK[14] otherwise
- Case GpmcFCLKDivider = 2:
  - F = 0.5 * CSExtraDelay * GPMC_FCLK[14] if ((CSOnTime – ClkActivationTime) is a multiple of 3)
  - F = (1 + 0.5 * CSExtraDelay) * GPMC_FCLK[14] if ((CSOnTime – ClkActivationTime – 1) is a multiple of 3)
  - F = (2 + 0.5 * CSExtraDelay) * GPMC_FCLK[14] if ((CSOnTime – ClkActivationTime – 2) is a multiple of 3)

(7) For ADV falling edge (ADV activated):
- Case GpmcFCLKDivider = 0:
  - G = 0.5 * ADVExtraDelay * GPMC_FCLK[14]
- Case GpmcFCLKDivider = 1:
  - G = 0.5 * ADVExtraDelay * GPMC_FCLK[14] if (ClkActivationTime and ADVOnTime are odd) or (ClkActivationTime and ADVOnTime are even)
  - G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK[14] otherwise
- Case GpmcFCLKDivider = 2:
  - G = 0.5 * ADVExtraDelay * GPMC_FCLK[14] if ((ADVOnTime – ClkActivationTime) is a multiple of 3)
  - G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK[14] if ((ADVOnTime – ClkActivationTime – 1) is a multiple of 3)
  - G = (2 + 0.5 * ADVExtraDelay) * GPMC_FCLK[14] if ((ADVOnTime – ClkActivationTime – 2) is a multiple of 3)

For ADV rising edge (ADV deactivated) in Reading mode:
- Case GpmcFCLKDivider = 0:
  - G = 0.5 * ADVExtraDelay * GPMC_FCLK[14]
- Case GpmcFCLKDivider = 1:
  - G = 0.5 * ADVExtraDelay * GPMC_FCLK[14] if (ClkActivationTime and ADVRdOffTime are odd) or (ClkActivationTime and ADVRdOffTime are even)
  - G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK[14] otherwise
- Case GpmcFCLKDivider = 2:
  - G = 0.5 * ADVExtraDelay * GPMC_FCLK[14] if ((ADVRdOffTime – ClkActivationTime) is a multiple of 3)
  - G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK[14] if ((ADVRdOffTime – ClkActivationTime – 1) is a multiple of 3)
  - G = (2 + 0.5 * ADVExtraDelay) * GPMC_FCLK[14] if ((ADVRdOffTime – ClkActivationTime – 2) is a multiple of 3)

For ADV rising edge (ADV deactivated) in Writing mode:
- Case GpmcFCLKDivider = 0:
  - G = 0.5 * ADVExtraDelay * GPMC_FCLK[14]
- Case GpmcFCLKDivider = 1:
  - G = 0.5 * ADVExtraDelay * GPMC_FCLK[14] if (ClkActivationTime and ADVWrOffTime are odd) or (ClkActivationTime and ADVWrOffTime are even)
  - G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK[14] otherwise
- Case GpmcFCLKDivider = 2:
  - G = 0.5 * ADVExtraDelay * GPMC_FCLK[14] if ((ADVWrOffTime – ClkActivationTime) is a multiple of 3)
  - G = (1 + 0.5 * ADVExtraDelay) * GPMC_FCLK[14] if ((ADVWrOffTime – ClkActivationTime – 1) is a multiple of 3)
  - G = (2 + 0.5 * ADVExtraDelay) * GPMC_FCLK[14] if ((ADVWrOffTime – ClkActivationTime – 2) is a multiple of 3)

(8) For OE falling edge (OE activated) / IO DIR rising edge (Data Bus input direction):
- Case GpmcFCLKDivider = 0: o H = 0.5 * OEExtraDelay * GPMC_FCLK[14]
- Case GpmcFCLKDivider = 1:
  - H = 0.5 * OEExtraDelay * GPMC_FCLK[14] if (ClkActivationTime and OEOnTime are odd) or (ClkActivationTime and OEOnTime are even)
  - H = (1 + 0.5 * OEExtraDelay) * GPMC_FCLK[14] otherwise
- Case GpmcFCLKDivider = 2:
  - H = 0.5 * OEExtraDelay * GPMC_FCLK[14] if ((OEOnTime – ClkActivationTime) is a multiple of 3)

  - H = (1 + 0.5 * OEExtraDelay) * GPMC_FCLK(14) if ((OEOnTime – ClkActivationTime – 1) is a multiple of 3)
  - H = (2 + 0.5 * OEExtraDelay) * GPMC_FCLK(14) if ((OEOnTime – ClkActivationTime – 2) is a multiple of 3)

For OE rising edge (OE deactivated):
- Case GpmcFCLKDivider = 0:
  - H = 0.5 * OEExtraDelay * GPMC_FCLK(14)
- Case GpmcFCLKDivider = 1:
  - H = 0.5 * OEExtraDelay * GPMC_FCLK(14) if (ClkActivationTime and OEOffTime are odd) or (ClkActivationTime and OEOffTime are even)
  - H = (1 + 0.5 * OEExtraDelay) * GPMC_FCLK(14) otherwise
- Case GpmcFCLKDivider = 2:
  - H = 0.5 * OEExtraDelay * GPMC_FCLK(14) if ((OEOffTime – ClkActivationTime) is a multiple of 3)
  - H = (1 + 0.5 * OEExtraDelay) * GPMC_FCLK(14) if ((OEOffTime – ClkActivationTime – 1) is a multiple of 3)
  - H = (2 + 0.5 * OEExtraDelay) * GPMC_FCLK(14) if ((OEOffTime – ClkActivationTime – 2) is a multiple of 3)

(9) For WE falling edge (WE activated):
- Case GpmcFCLKDivider = 0:
  - I = 0.5 * WEExtraDelay * GPMC_FCLK(14)
- Case GpmcFCLKDivider = 1:
  - I = 0.5 * WEExtraDelay * GPMC_FCLK(14) if (ClkActivationTime and WEOnTime are odd) or (ClkActivationTime and WEOnTime are even)
  - I = (1 + 0.5 * WEExtraDelay) * GPMC_FCLK(14) otherwise
- Case GpmcFCLKDivider = 2:
  - I = 0.5 * WEExtraDelay * GPMC_FCLK(14) if ((WEOnTime – ClkActivationTime) is a multiple of 3)
  - I = (1 + 0.5 * WEExtraDelay) * GPMC_FCLK(14) if ((WEOnTime – ClkActivationTime – 1) is a multiple of 3)
  - I = (2 + 0.5 * WEExtraDelay) * GPMC_FCLK(14) if ((WEOnTime – ClkActivationTime – 2) is a multiple of 3)

For WE rising edge (WE deactivated):
- Case GpmcFCLKDivider = 0:
  - I = 0.5 * WEExtraDelay * GPMC_FCLK (14)
- Case GpmcFCLKDivider = 1:
  - I = 0.5 * WEExtraDelay * GPMC_FCLK(14) if (ClkActivationTime and WEOffTime are odd) or (ClkActivationTime and WEOffTime are even)
  - I = (1 + 0.5 * WEExtraDelay) * GPMC_FCLK(14) otherwise
- Case GpmcFCLKDivider = 2:
  - I = 0.5 * WEExtraDelay * GPMC_FCLK(14) if ((WEOffTime – ClkActivationTime) is a multiple of 3)
  - I = (1 + 0.5 * WEExtraDelay) * GPMC_FCLK(14) if ((WEOffTime – ClkActivationTime – 1) is a multiple of 3)
  - I = (2 + 0.5 * WEExtraDelay) * GPMC_FCLK(14) if ((WEOffTime – ClkActivationTime – 2) is a multiple of 3)

(10) J = GPMC_FCLK(14)

(11) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, 2, or 3.

(12) P = gpmc_clk period in ns

(13) For read: K = (ADVRdOffTime – ADVOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK(14)
For write: K = (ADVWrOffTime – ADVOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK(14)

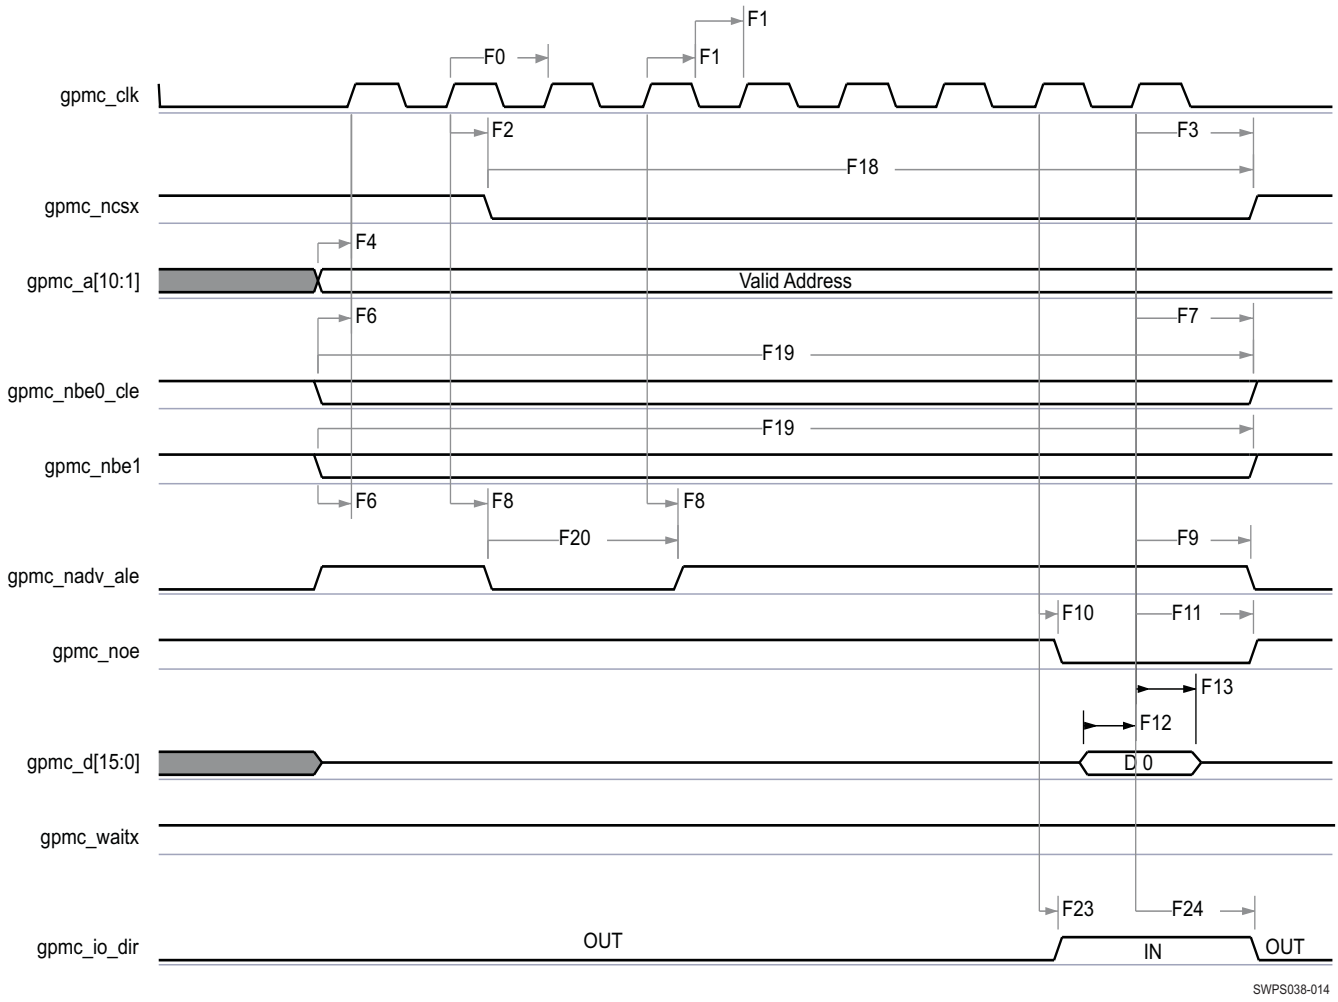
(14) GPMC_FCLK is general-purpose memory controller internal functional clock period in ns.

(15) Related to the gpmc_clk output clock maximum and minimum frequencies programmable in the GPMC module by setting the GPMC_CONFIG1_CSx configuration register bit field GpmcFCLKDivider.

(16) The jitter probability density can be approximated by a Gaussian function.

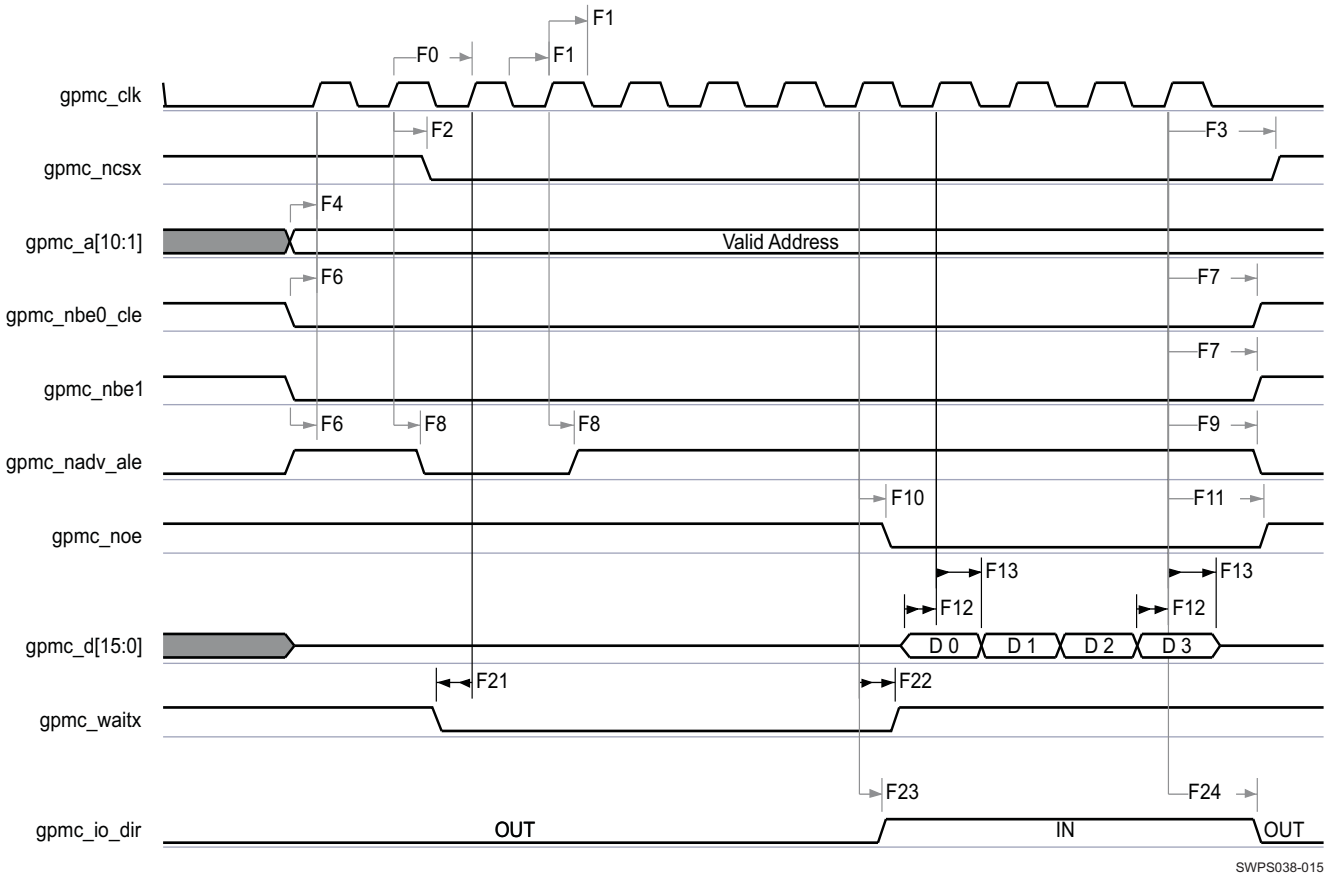
(17) M = (RdCycleTime – AccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK(14)
Above M parameter expression is given as one example of GPMC programming. IO DIR signal will go from IN to OUT after both RdCycleTime and BusTurnAround completion. Behavior of IO direction signal does depend on kind of successive Read/Write accesses performed to Memory and multiplexed or nonmultiplexed memory addressing scheme, bus keeping feature enabled or not. IO DIR behaviour is automatically handled by GPMC controller. For a full description of the gpmc_io_dir feature, see the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(18) See Section 4.3.4, *Processor Clocks*.



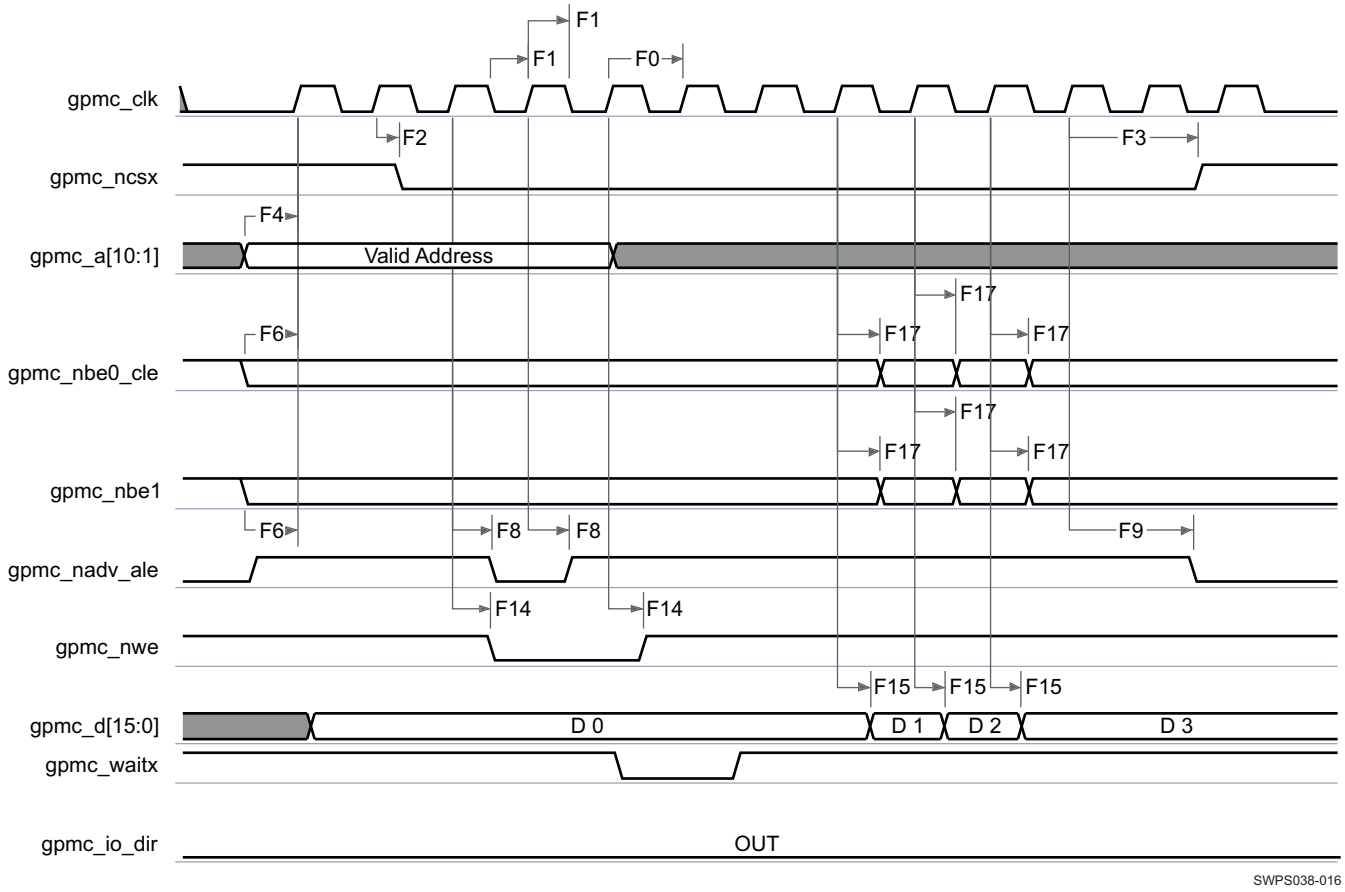
(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.
(2) In gpmc_waitx, x is equal to 0, 1, 2, or 3.

Figure 6-2. GPMC/NOR Flash—Synchronous Single Read—(GpmcFCLKDivider = 0)



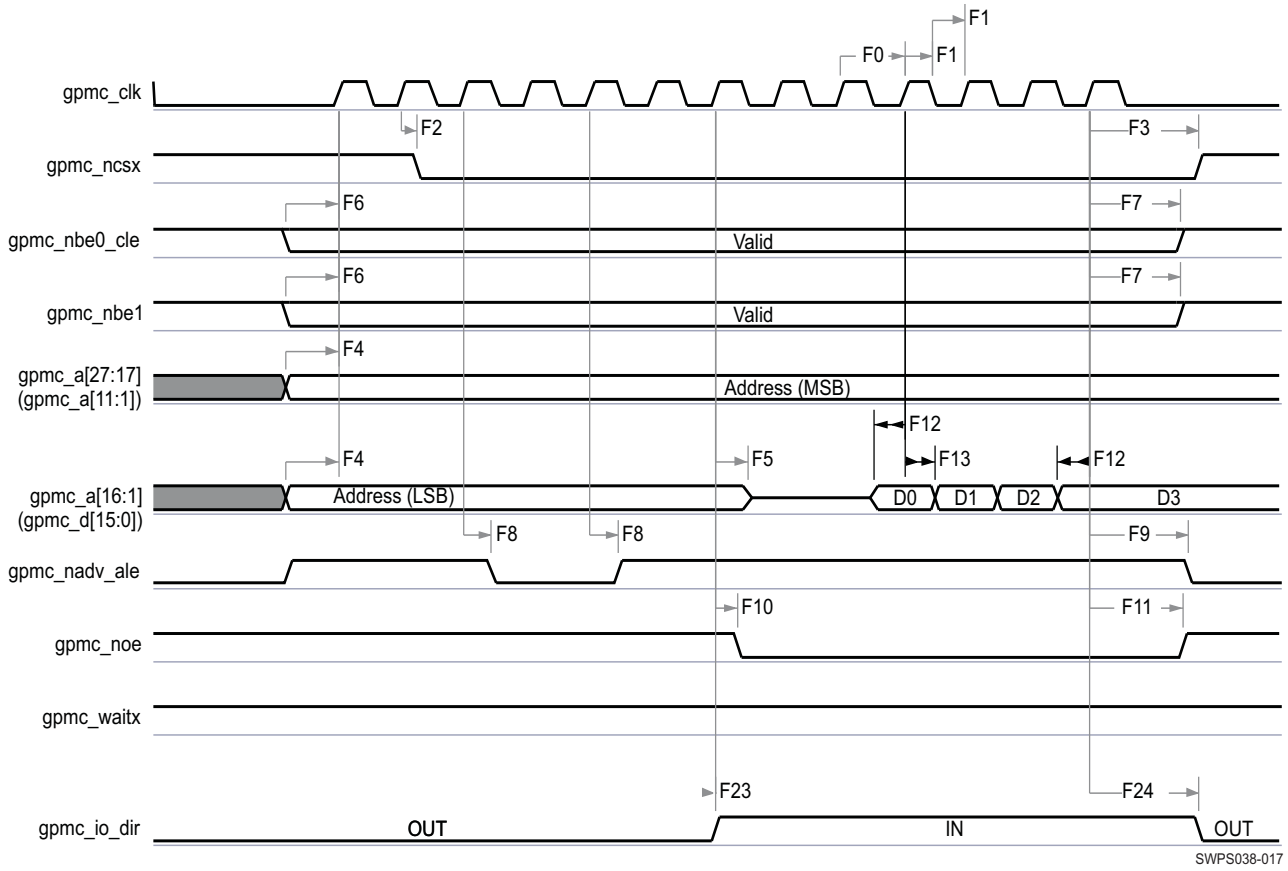
(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.
(2) In gpmc_waitx, x is equal to 0, 1, 2, or 3.

Figure 6-3. GPMC/NOR Flash—Synchronous Burst Read—4x16-bit (GpmcFCLKDivider = 0)



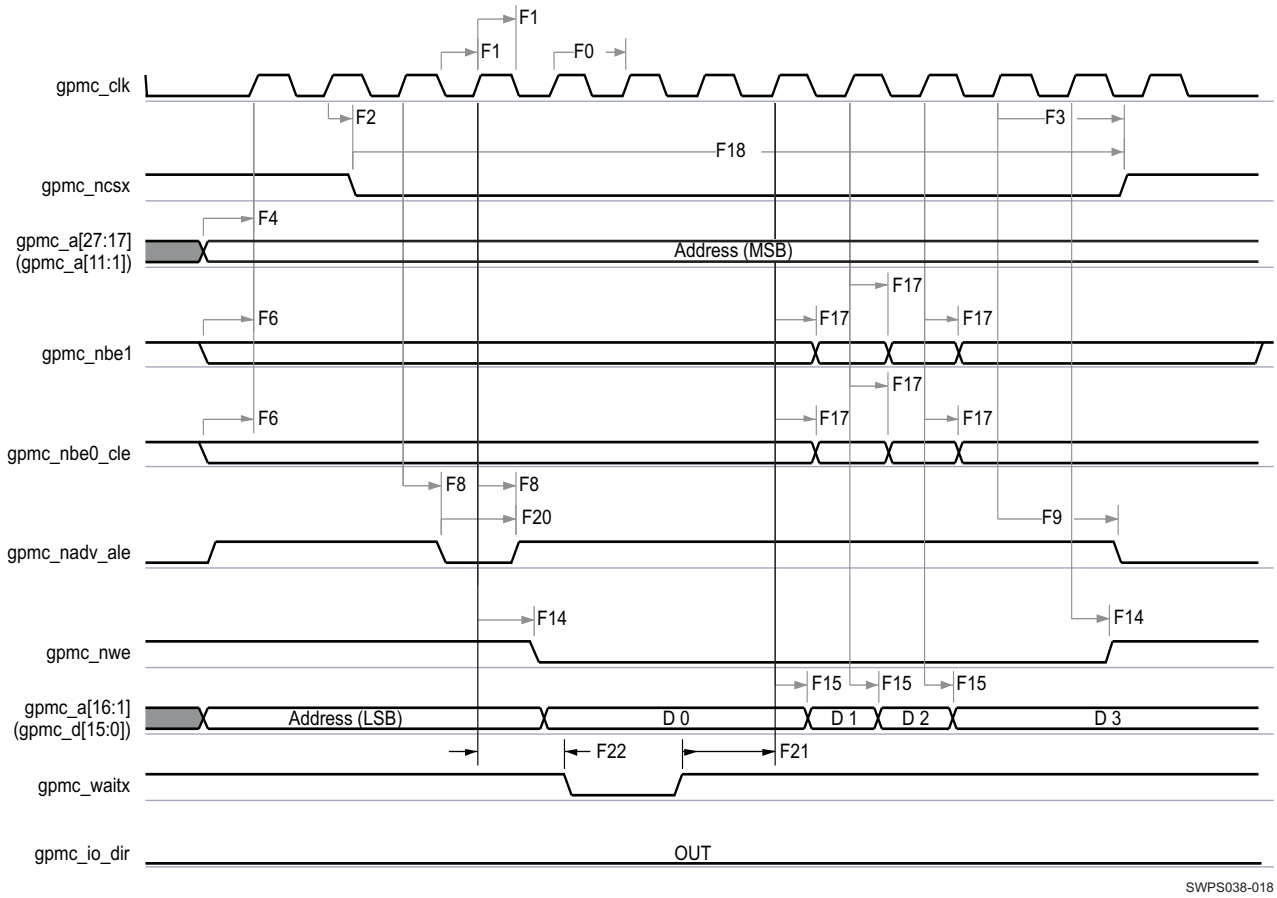
(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.
(2) In gpmc_waitx, x is equal to 0, 1, 2, or 3.

Figure 6-4. GPMC/NOR Flash—Synchronous Burst Write—(GpmcFCLKDivider > 0)



(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.
(2) In gpmc_waitx, x is equal to 0, 1, 2, or 3.

Figure 6-5. GPMC/Multiplexed NOR Flash—Synchronous Burst Read



(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

(2) In gpmc_waitx, x is equal to 0, 1, 2, or 3.

Figure 6-6. GPMC/Multiplexed NOR Flash—Synchronous Burst Write

6.4.1.2 GPMC/NOR Flash—Asynchronous Mode

Table 6-6 and Table 6-7 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-7 through Figure 6-12).

Table 6-5. GPMC/NOR Flash Timing Conditions—Asynchronous Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	1.8	ns
t_F	Input signal fall time	1.8	ns
Output Conditions			
C_{LOAD}	Output load capacitance(1)	16	pF

(1) The load setting of the IO buffer: LB0 = 0.

Table 6-6. GPMC/NOR Flash Internal Timing Parameters—Asynchronous Mode(1) (2) (4)

NO.	PARAMETER	OPP100		OPP50		UNIT
		MIN	MAX	MIN	MAX	
FI1	Delay time, output data gpmc_d[15:0] generation from internal functional clock GPMC_FCLK(3)		6.6		7.0	ns
FI2	Delay time, input data gpmc_d[15:0] capture from internal functional clock GPMC_FCLK(3)		4.4		7.0	ns
FI3	Delay time, output chip select gpmc_ncsx generation from internal functional clock GPMC_FCLK(3)		6.5		7.0	ns
FI4	Delay time, output address gpmc_a[27:1] generation from internal functional clock GPMC_FCLK(3)		7.6		7.0	ns
FI5	Delay time, output address gpmc_a[27:1] valid from internal functional clock GPMC_FCLK(3)		7.6		7.0	ns
FI6	Delay time, output lower-byte enable/command latch enable gpmc_nbe0_cle, output upper-byte enable gpmc_nbe1 generation from internal functional clock GPMC_FCLK(3)		6.5		7.0	ns
FI7	Delay time, output enable gpmc_noe generation from internal functional clock GPMC_FCLK(3)		5.8		7.0	ns
FI8	Delay time, output write enable gpmc_nwe generation from internal functional clock GPMC_FCLK(3)		7.0		7.0	ns
FI9	Skew, internal functional clock GPMC_FCLK(3)		100		170	ps
FI10	Delay time, IO direction generation from internal functional clock GPMC_FCLK(3)		6.3		7.0	ps

(1) The internal parameters table must be used to calculate data access time stored in the corresponding CS register bit field.

(2) Internal parameters are referred to the GPMC functional internal clock which is not provided externally.

(3) GPMC_FCLK is general-purpose memory controller internal functional clock.

(4) See Section 4.3.4, *Processor Clocks*.

Table 6-7. GPMC/NOR Flash Timing Requirements—Asynchronous Mode[7]

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
FA5[1]	$t_{acc(d)}$	Data access time		H[5]		H[5]	ns
FA20[3]	$t_{acc1\text{-}pgmode(d)}$	Page mode successive data access time		P[4]		P[4]	ns
FA21[2]	$t_{acc2\text{-}pgmode(d)}$	Page mode first data access time		H[5]		H[5]	ns

(1) The FA5 parameter illustrates the amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data is internally sampled by active functional clock edge. FA5 value must be stored inside the AccessTime register bit field.

(2) The FA21 parameter illustrates amount of time required to internally sample first input page data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, first input page data is internally sampled by active functional clock edge. FA21 value must be stored inside the AccessTime register bit field.

(3) The FA20 parameter illustrates amount of time required to internally sample successive input page data. It is expressed in number of GPMC functional clock cycles. After each access to input page data, next input page data is internally sampled by active functional clock edge after FA20 functional clock cycles. The FA20 value must be stored in the PageBurstAccessTime register bit field.

(4) P = PageBurstAccessTime * (TimeParaGranularity + 1) * GPMC_FCLK[6]

(5) H = AccessTime * (TimeParaGranularity + 1) * GPMC_FCLK[6]

(6) GPMC_FCLK is general-purpose memory controller internal functional clock period in ns.

(7) See Section 4.3.4, *Processor Clocks*.

Table 6-8. GPMC/NOR Flash Switching Characteristics—Asynchronous Mode[16]

NO.	PARAMETER			OPP100		OPP50		UNIT
				MIN	MAX	MIN	MAX	
	$t_{R(d)}$	Rise time, output data gpmc_d[15:0]			2		2	ns
	$t_{F(d)}$	Fall time, output data gpmc_d[15:0]			2		2	ns
FA0	$t_{w(nbeV)}$	Pulse duration, output lower-byte enable/command latch enable gpmc_nbe0_cle, output upper-byte enable gpmc_nbe1 valid time	Read	N[12]		N[12]		ns

FA37	$t_{d(noeV-aIV)}$	Delay time, output enable gpmc_noe valid to output address gpmc_a[16:1]_d[15:0] phase end		2.0		2.6	ns

(1) For single read: A = (CSRdOffTime – CSOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK[15]
For single write: A = (CSWrOffTime – CSOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK[15]
For burst read: A = (CSRdOffTime – CSOnTime + (n – 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[15]
For burst write: A = (CSWrOffTime – CSOnTime + (n – 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[15]
with n being the page burst access number

(2) For reading: B = ((ADVRdOffTime – CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (ADVExtraDelay – CSExtraDelay)) * GPMC_FCLK[15]
For writing: B = ((ADVWrOffTime – CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (ADVExtraDelay – CSExtraDelay)) * GPMC_FCLK[15]

(3) C = ((OEOffTime – CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (OEExtraDelay – CSExtraDelay)) * GPMC_FCLK[15]

(4) D = PageBurstAccessTime * (TimeParaGranularity + 1) * GPMC_FCLK[15]

(5) E = ((WEOnTime – CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEExtraDelay – CSExtraDelay)) * GPMC_FCLK[15]

(6) F = ((WEOffTime – CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEExtraDelay – CSExtraDelay)) * GPMC_FCLK[15]

(7) G = Cycle2CycleDelay * GPMC_FCLK[15]

(8) I = ((OEOffTime + (n – 1) * PageBurstAccessTime – CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (OEExtraDelay – CSExtraDelay)) * GPMC_FCLK[15]

(9) J = (CSOnTime * (TimeParaGranularity + 1) + 0.5 * CSExtraDelay) * GPMC_FCLK[15]

(10) K = ((ADVOnTime – CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (ADVExtraDelay – CSExtraDelay)) * GPMC_FCLK[15]

(11) L = ((OEOnTime – CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (OEExtraDelay – CSExtraDelay)) * GPMC_FCLK[15]

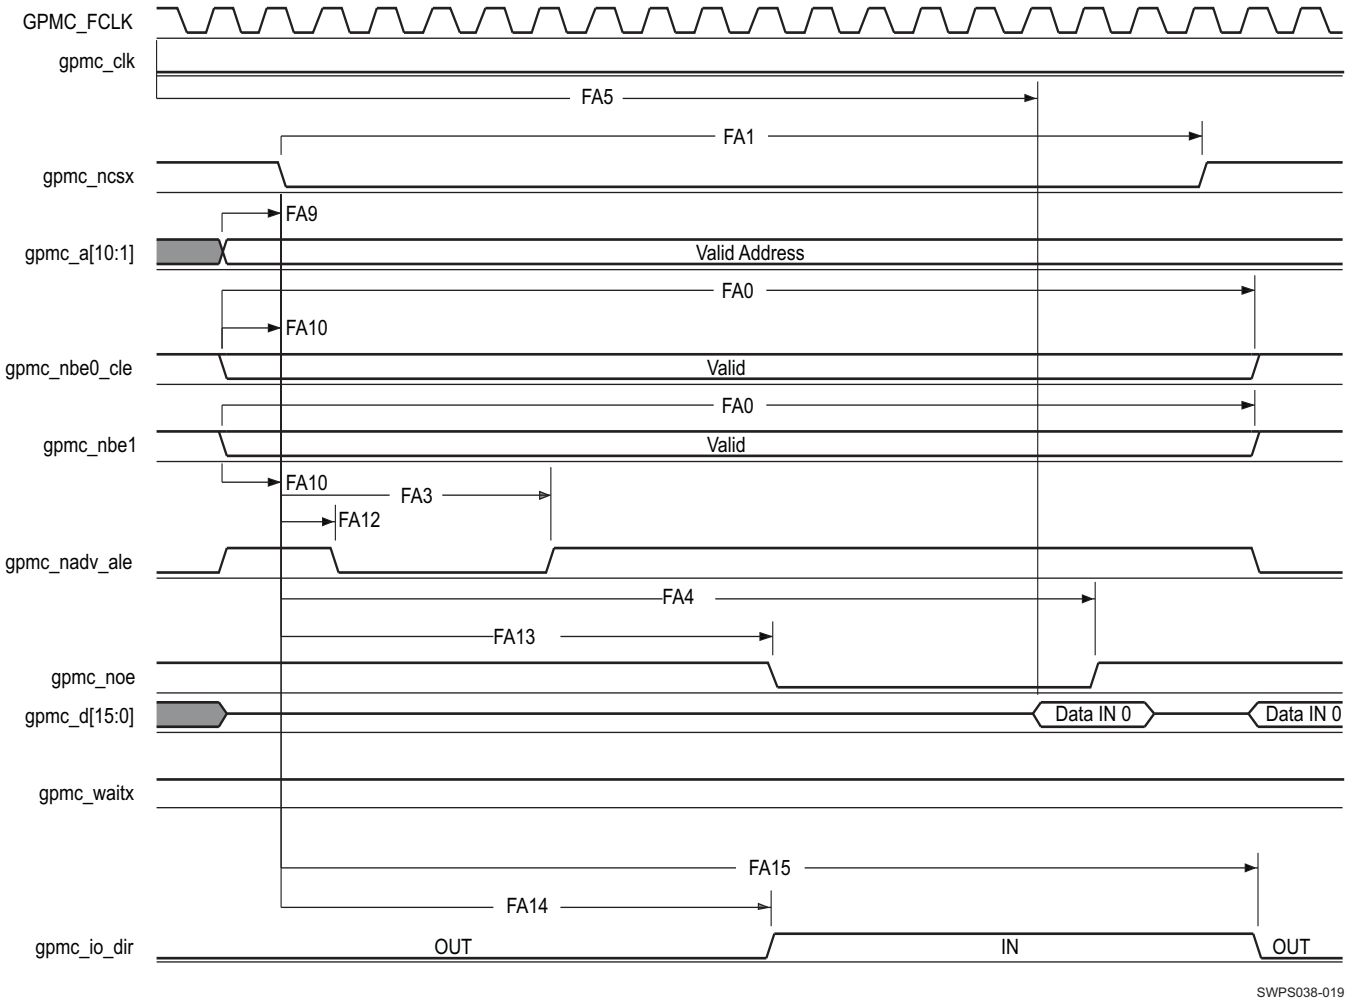
(12) For single read: N = RdCycleTime * (TimeParaGranularity + 1) * GPMC_FCLK[15]
For single write: N = WrCycleTime * (TimeParaGranularity + 1) * GPMC_FCLK[15]
For burst read: N = (RdCycleTime + (n – 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[15]
For burst write: N = (WrCycleTime + (n – 1) * PageBurstAccessTime) * (TimeParaGranularity + 1) * GPMC_FCLK[15]

(13) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

(14) M = ((RdCycleTime – CSOnTime) * (TimeParaGranularity + 1) – 0.5 * CSExtraDelay) * GPMC_FCLK[15]
Above M parameter expression is given as one example of GPMC programming. IO DIR signal will go from IN to OUT after both RdCycleTime and BusTurnAround completion. Behavior of IO direction signal does depend on kind of successive Read/Write accesses performed to Memory and multiplexed or nonmultiplexed memory addressing scheme, bus keeping feature enabled or not. IO DIR behaviour is automatically handled by GPMC controller. For a full description of the gpmc_io_dir feature, see the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(15) GPMC_FCLK is general-purpose memory controller internal functional clock period in ns.

(16) See Section 4.3.4, *Processor Clocks*.

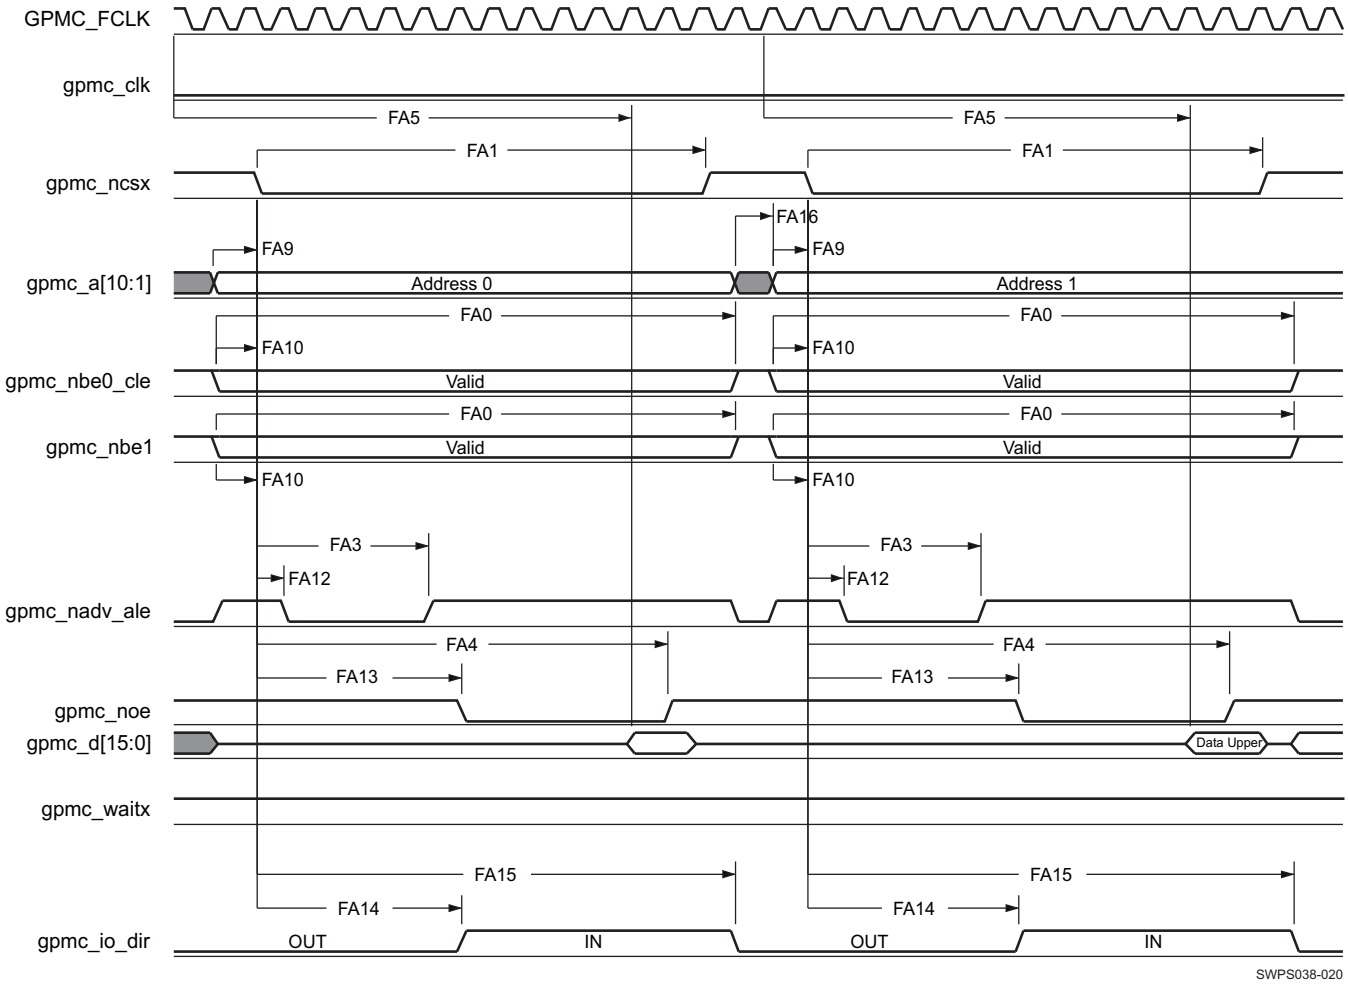


(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, 2, or 3.

(2) FA5 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data will be internally sampled by active functional clock edge. FA5 value must be stored inside AccessTime register bits field.

(3) GPMC_FCLK is an internal clock (GPMC functional clock) not provided externally.

Figure 6-7. GPMC / NOR Flash—Asynchronous Read—Single Word

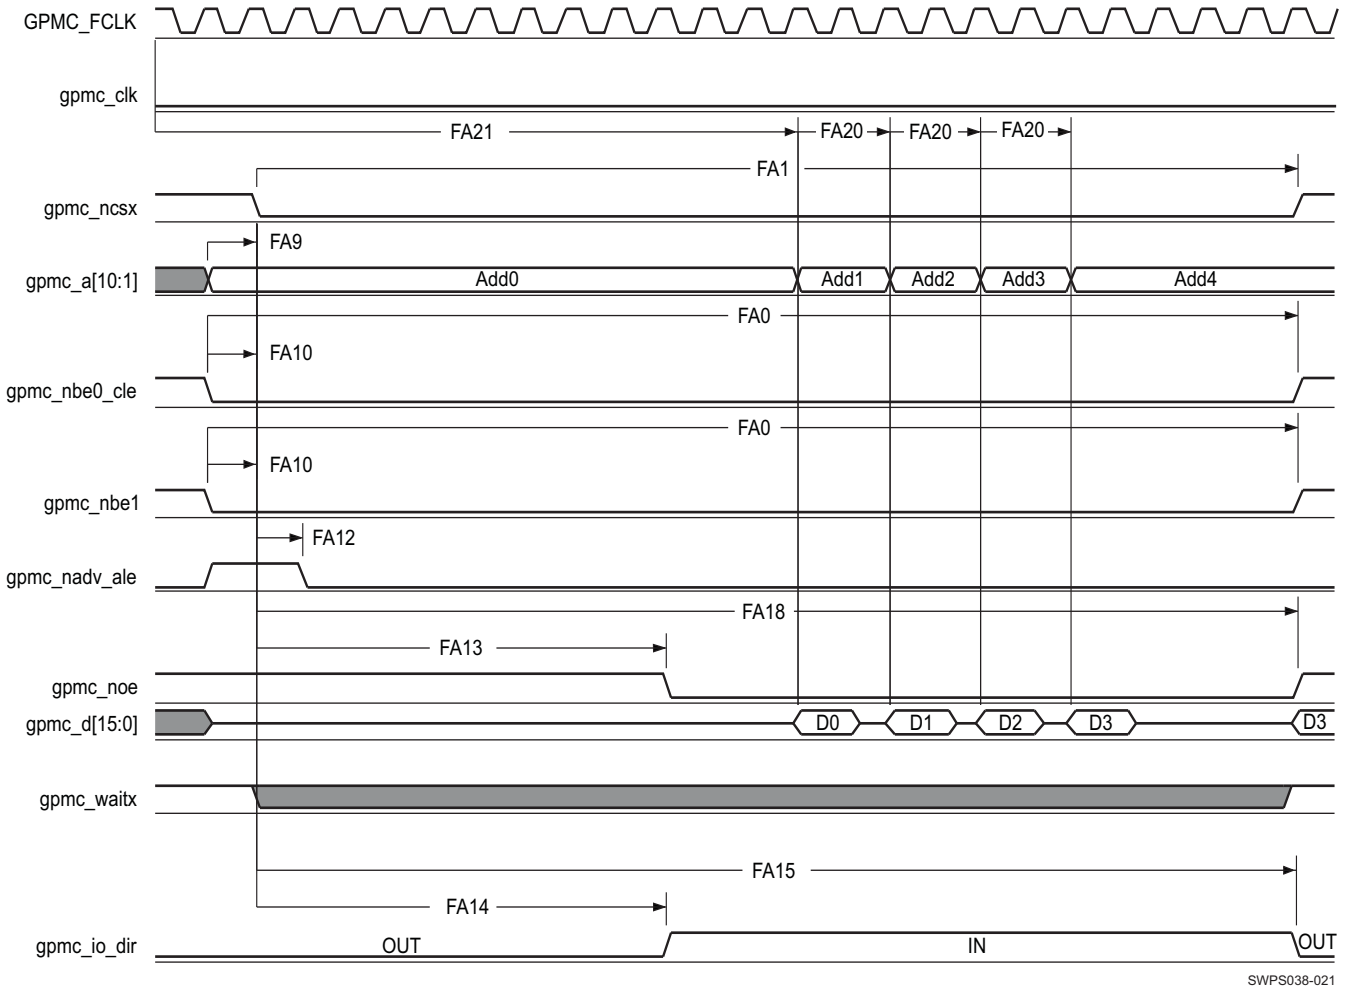


(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, 2, or 3.

(2) FA5 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data will be internally sampled by active functional clock edge. FA5 value must be stored inside AccessTime register bits field.

(3) GPMC_FCLK is an internal clock (GPMC functional clock) not provided externally.

Figure 6-8. GPMC / NOR Flash—Asynchronous Read—32-bit



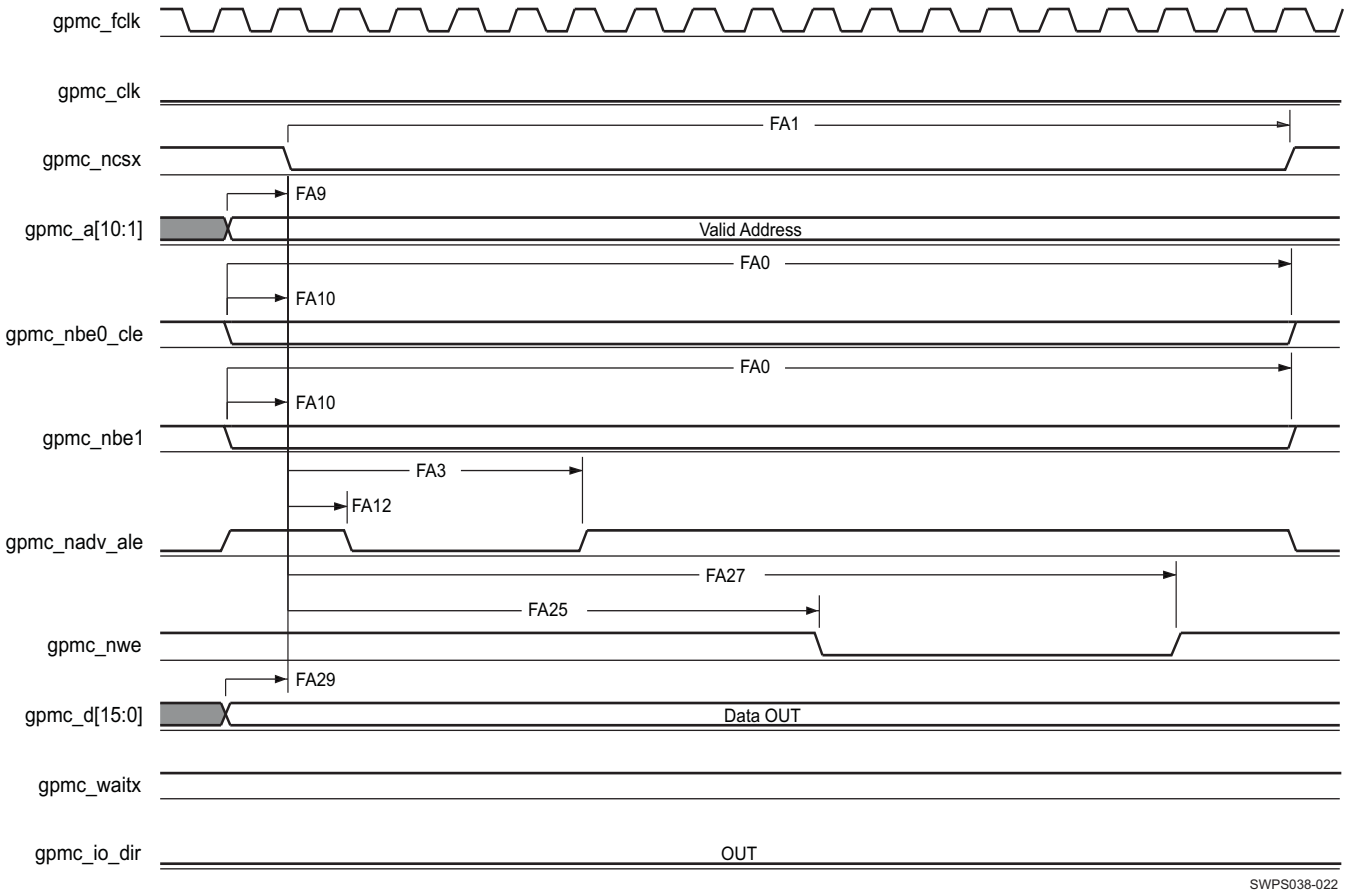
(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, 2, or 3.

(2) FA21 parameter illustrates amount of time required to internally sample first input page data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA21 functional clock cycles, first input page data will be internally sampled by active functional clock edge. FA21 calculation must be stored inside AccessTime register bits field.

(3) FA20 parameter illustrates amount of time required to internally sample successive input page data. It is expressed in number of GPMC functional clock cycles. After each access to input page data, next input page data will be internally sampled by active functional clock edge after FA20 functional clock cycles. FA20 is also the duration of address phases for successive input page data (excluding first input page data). FA20 value must be stored in PageBurstAccessTime register bits field.

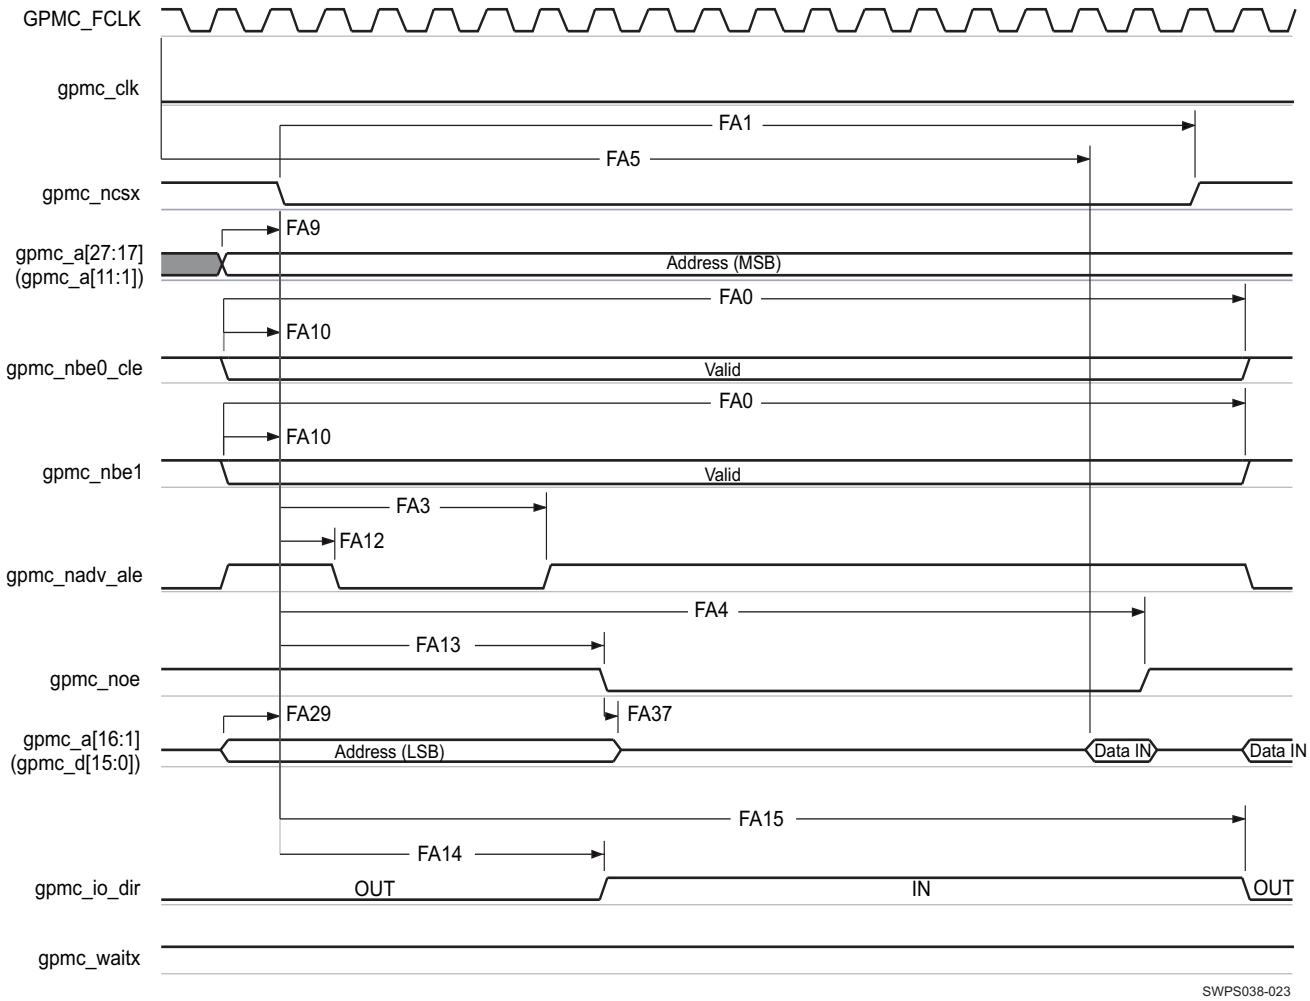
(4) GPMC_FCLK is an internal clock (GPMC functional clock) not provided externally.

Figure 6-9. GPMC / NOR Flash—Asynchronous Read—Page Mode 4x16-bit



(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, 2, or 3.

Figure 6-10. GPMC / NOR Flash—Asynchronous Write—Single Word

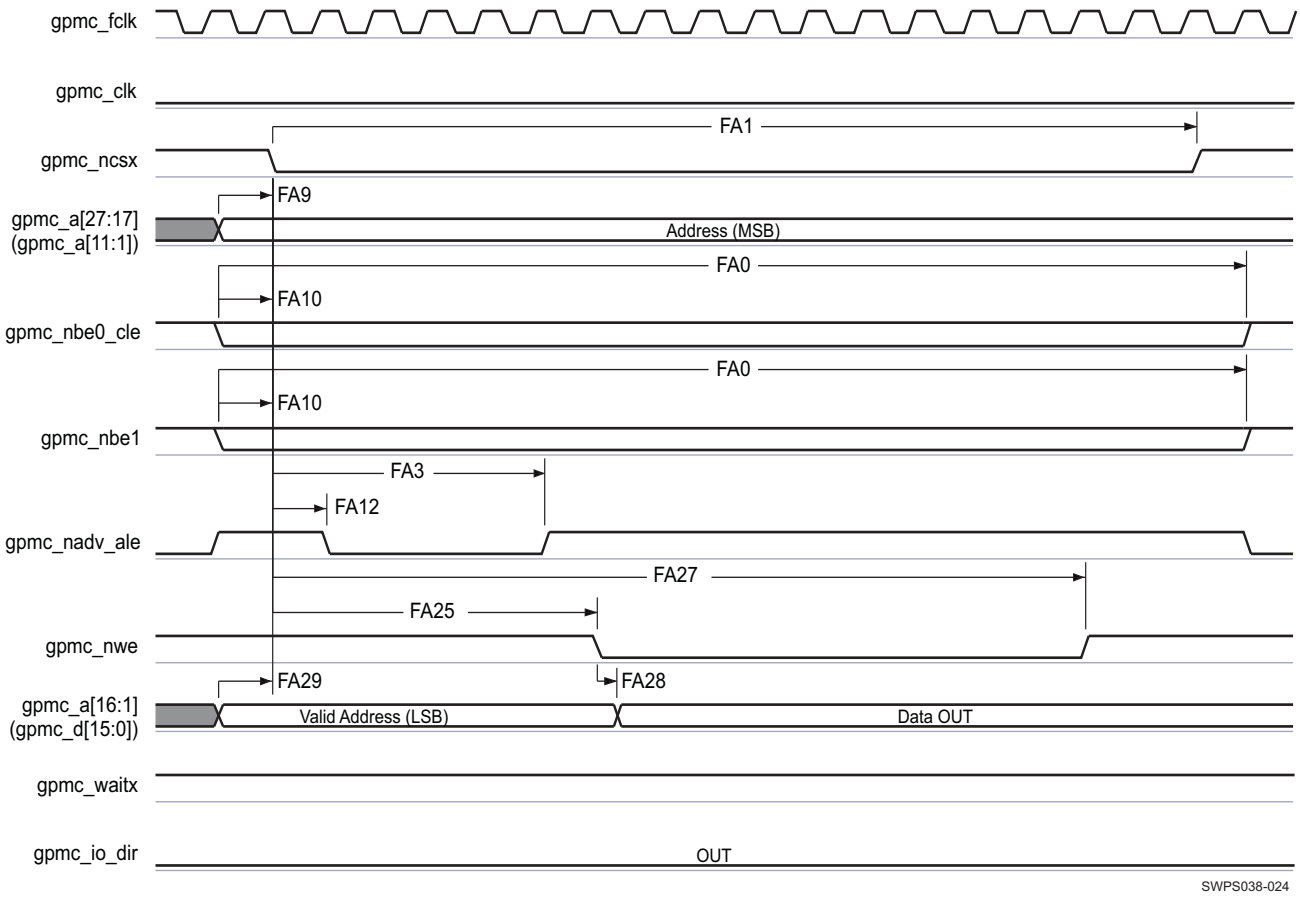


(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, 2, or 3.

(2) FA5 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after FA5 functional clock cycles, input data will be internally sampled by active functional clock edge. FA5 value must be stored inside AccessTime register bits field.

(3) GPMC_FCLK is an internal clock (GPMC functional clock) not provided externally.

Figure 6-11. GPMC / Multiplexed NOR Flash—Asynchronous Read—Single Word



(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, 2, or 3.

Figure 6-12. GPMC / Multiplexed NOR Flash—Asynchronous Write—Single Word

6.4.1.3 GPMC/NAND Flash—Asynchronous Mode

Table 6-10 and Table 6-11 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-13 through Figure 6-16).

Table 6-9. GPMC/NAND Flash Timing Conditions—Asynchronous Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	1.8	ns
t_F	Input signal fall time	1.8	ns
Output Conditions			
C_{LOAD}	Output load capacitance(1)	16	pF

(1) The load setting of the IO buffer: LB0 = 0.

Table 6-10. GPMC/NAND Flash Internal Timing Parameters—Asynchronous Mode(1) (2) (4)

NO.	PARAMETER	OPP100		OPP50		UNIT
		MIN	MAX	MIN	MAX	
GNFI1	Delay time, output data gpmc_d[15:0] generation from internal functional clock GPMC_FCLK(3)		6.5		9.1	ns
GNFI2	Delay time, input data gpmc_d[15:0] capture from internal functional clock GPMC_FCLK(3)		4.0		5.6	ns
GNFI3	Delay time, output chip select gpmc_ncsx generation from internal functional clock GPMC_FCLK(3)		6.5		9.1	ns
GNFI4	Delay time, output address valid/address latch enable gpmc_nadv_ale generation from internal functional clock GPMC_FCLK(3)		6.5		9.1	ns
GNFI5	Delay time, output lower-byte enable/command latch enable gpmc_nbe0_cle generation from internal functional clock GPMC_FCLK(3)		6.5		9.1	ns
GNFI6	Delay time, output enable gpmc_noe generation from internal functional clock GPMC_FCLK(3)		6.5		9.1	ns
GNFI7	Delay time, output write enable gpmc_nwe generation from internal functional clock GPMC_FCLK(3)		6.5		9.1	ns
GNFI8	Skew, functional clock GPMC_FCLK(3)		100		170	ps

(1) Internal parameters table must be used to calculate data access time stored in the corresponding CS register bit field.

(2) Internal parameters are referred to the GPMC functional internal clock which is not provided externally.

(3) GPMC_FCLK is general-purpose memory controller internal functional clock.

(4) See Section 4.3.4, *Processor Clocks*.

Table 6-11. GPMC/NAND Flash Timing Requirements—Asynchronous Mode(4)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
GNF12(1)	$t_{acc(d)}$	Access time, input data gpmc_d[15:0]		J(2)		J(2)	ns

(1) The GNF12 parameter illustrates the amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of the read cycle and after GNF12 functional clock cycles, input data is internally sampled by the active functional clock edge. The GNF12 value must be stored inside AccessTime register bit field.

(2) J = AccessTime * (TimeParaGranularity + 1) * GPMC_FCLK(3)

(3) GPMC_FCLK is general-purpose memory controller internal functional clock period in ns.

(4) See Section 4.3.4, *Processor Clocks*.

(1) A = (WEOffTime – WEOnTime) * (TimeParaGranularity + 1) * GPMC_FCLK[14]

(2) B = ((WEOnTime – CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEExtraDelay – CSExtraDelay)) * GPMC_FCLK[14]

(3) C = ((WEOnTime – ADVOnTime) * (TimeParaGranularity + 1) + 0.5 * (WEExtraDelay – ADVExtraDelay)) * GPMC_FCLK[14]

(4) D = (WEOnTime * (TimeParaGranularity + 1) + 0.5 * WEExtraDelay) * GPMC_FCLK[14]

(5) E = ((WrCycleTime – WEOffTime) * (TimeParaGranularity + 1) – 0.5 * WEExtraDelay) * GPMC_FCLK[14]

(6) F = ((ADVWrOffTime – WEOffTime) * (TimeParaGranularity + 1) + 0.5 * (ADVExtraDelay – WEExtraDelay)) * GPMC_FCLK[14]

(7) G = ((CSWrOffTime – WEOffTime) * (TimeParaGranularity + 1) + 0.5 * (CSExtraDelay – WEExtraDelay)) * GPMC_FCLK[14]

(8) H = WrCycleTime * (1 + TimeParaGranularity) * GPMC_FCLK[14]

(9) I = ((OEOnTime – CSOnTime) * (TimeParaGranularity + 1) + 0.5 * (OEExtraDelay – CSExtraDelay)) * GPMC_FCLK[14]

(10) K = (OEOffTime – OEOnTime) * (1 + TimeParaGranularity) * GPMC_FCLK[14]

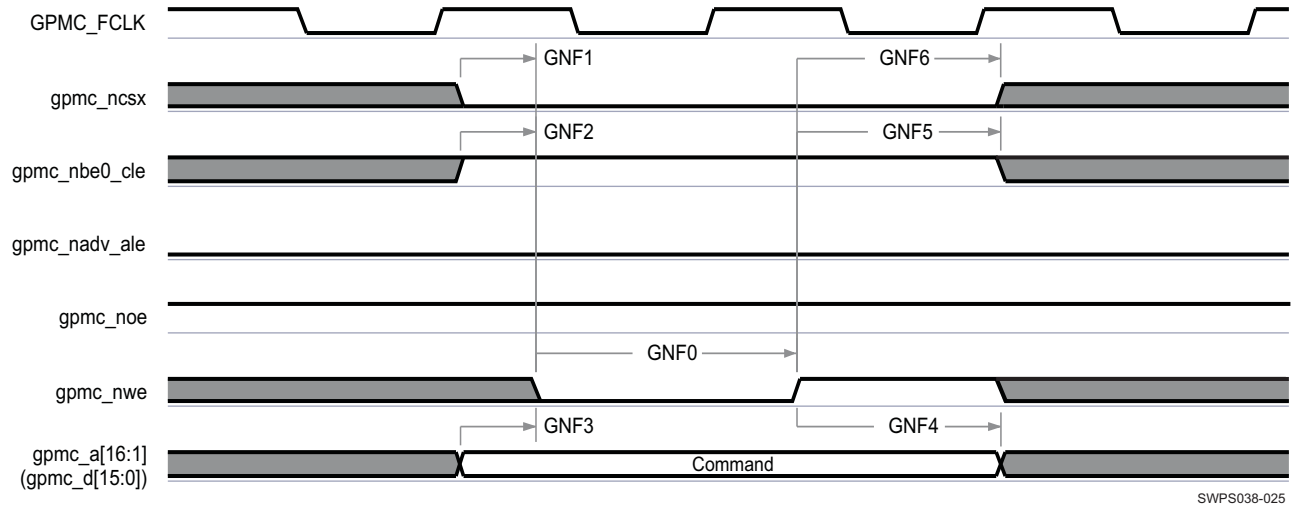
(11) L = RdCycleTime * (1 + TimeParaGranularity) * GPMC_FCLK[14]

(12) M = ((CSRdOffTime – OEOffTime) * (TimeParaGranularity + 1) + 0.5 * (CSExtraDelay – OEExtraDelay)) * GPMC_FCLK[14]

(13) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

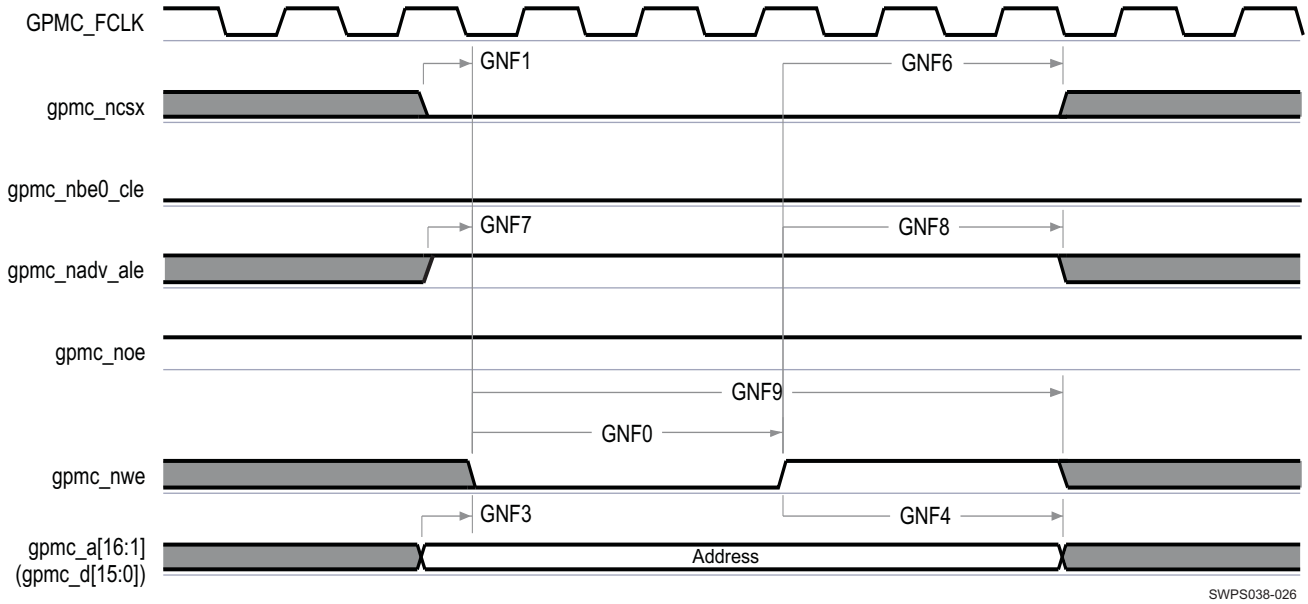
(14) GPMC_FCLK is general-purpose memory controller internal functional clock period in ns.

(15) See Section 4.3.4, *Processor Clocks*.



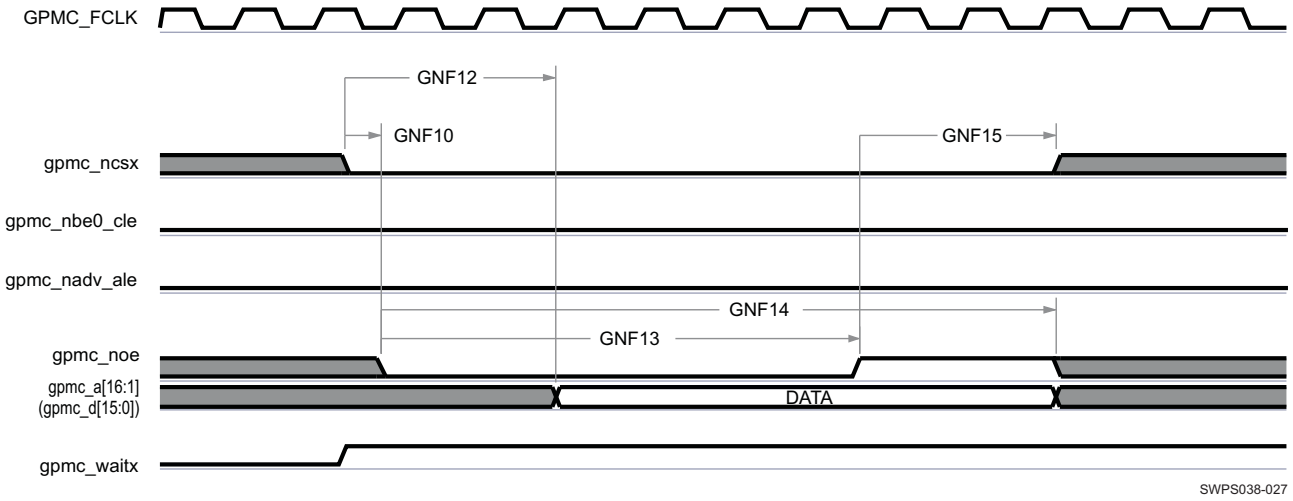
(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

Figure 6-13. GPMC / NAND Flash—Command Latch Cycle



(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

Figure 6-14. GPMC / NAND Flash—Address Latch Cycle

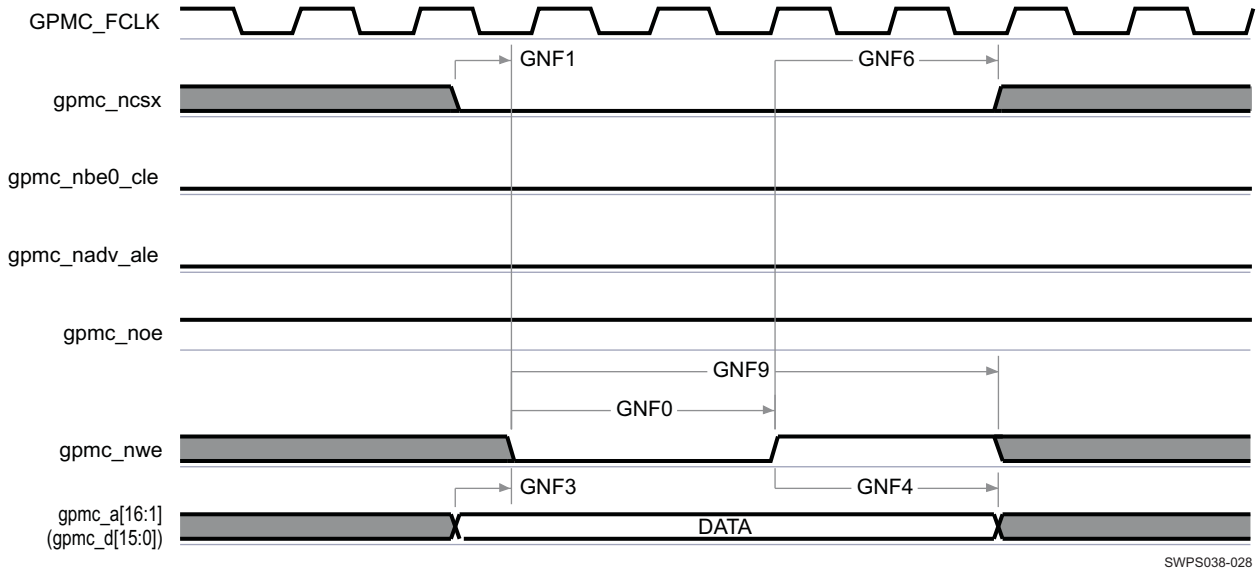


(1) GNF12 parameter illustrates amount of time required to internally sample input data. It is expressed in number of GPMC functional clock cycles. From start of read cycle and after GNF12 functional clock cycles, input data will be internally sampled by active functional clock edge. GNF12 value must be stored inside AccessTime register bits field.

(2) GPMC_FCLK is an internal clock (GPMC functional clock) not provided externally.

(3) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7. In gpmc_waitx, x is equal to 0, 1, 2, or 3.

Figure 6-15. GPMC / NAND Flash—Data Read Cycle



(1) In gpmc_ncsx, x is equal to 0, 1, 2, 3, 4, 5, 6, or 7.

Figure 6-16. GPMC / NAND Flash—Data Write Cycle

6.4.2 SDRAM Memory Controller (SDRC)

NOTE

For more information, see Memory Subsystem / SDRAM Controller (SDRC) Subsystem section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

The SDRAM controller subsystem module provides connectivity between the processor and external DRAM memory components. The module includes support for double-data-rate SDRAM (mobile DDR).

6.4.2.1 LPDDR Interface

The LPDDR interface is balled out on the bottom side of the CUS package and on the top side of the POP packages. The LPDDR interface on the top of the POP package has been designed for compatibility any POP LPDDR device with a matching footprint and compliance with the JEDEC LPDDR-266 specification.

This section provides the timing specification for the bottom-side LPDDR interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. These rules, when followed, result in a reliable LPDDR memory system without the need for a complex timing closure process. For more information regarding guidelines for using this LPDDR specification, see the *Understanding TI's PCB Routing Rule-Based DDR Timing Specification* Application Report (literature number SPRAAV0).

6.4.2.1.1 LPDDR Interface Schematic

Figure 6-17 and Figure 6-18 show the LPDDR interface schematics for a LPDDR memory system. The 1 x16 LPDDR system schematic is identical to Figure 6-17 except that the high word LPDDR device is deleted.

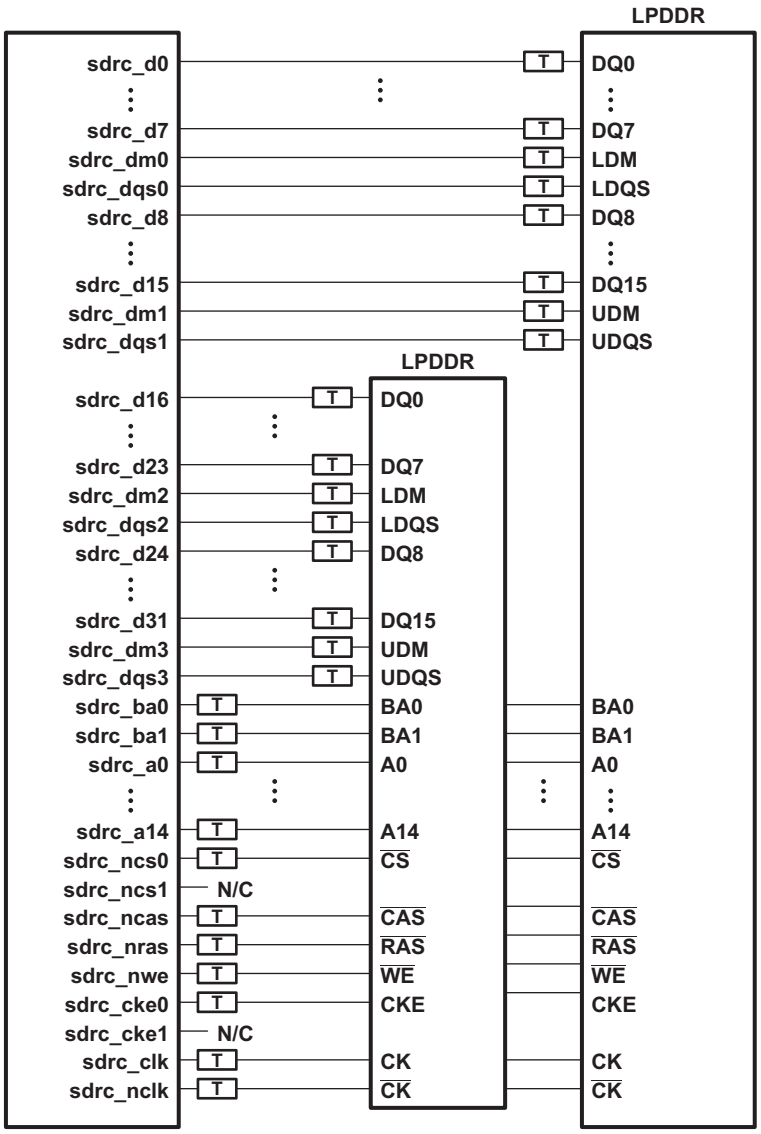


Figure 6-17. DM37x LPDDR High Level Schematic (x16 memories)

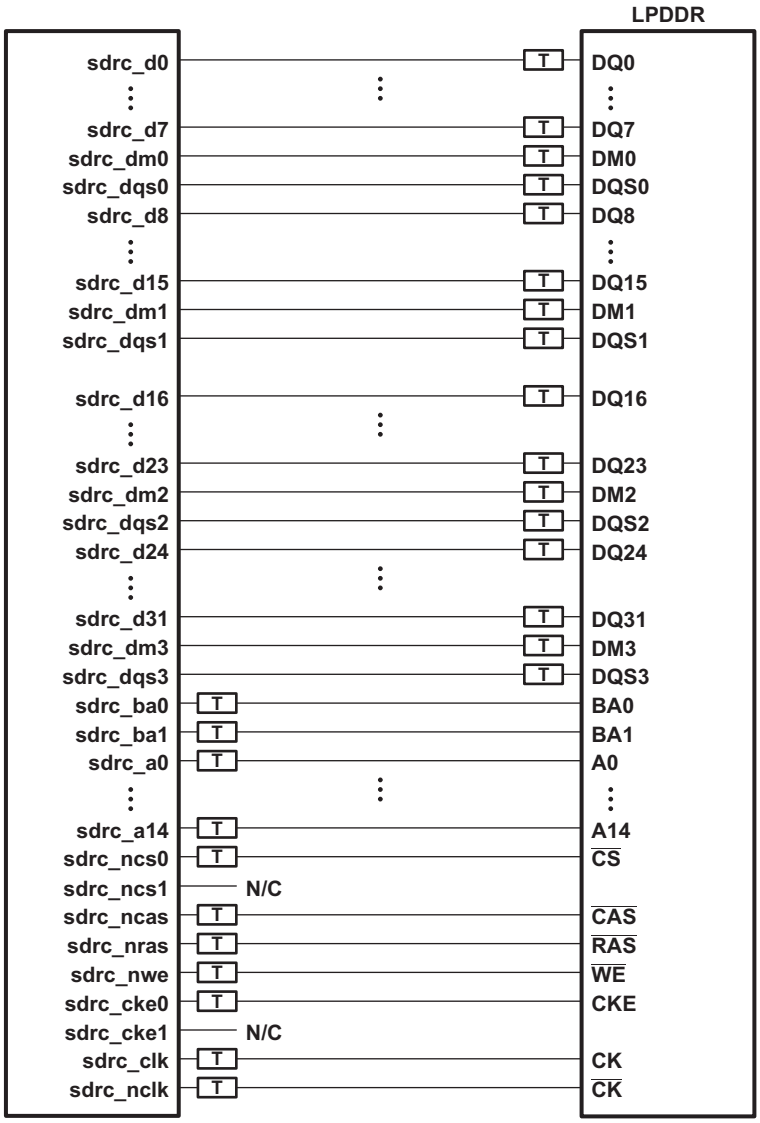

Figure 6-18. DM37x LPDDR High Level Schematic (x32 memory)

6.4.2.1.2 Compatible JEDEC LPDDR Devices

Table 6-13 shows the parameters of the JEDEC LPDDR devices that are compatible with this interface. Generally, the LPDDR interface is compatible with x16 and x32 LPDDR266 and LPDDR333 speed grade LPDDR devices.

Table 6-13. Compatible JEDEC LPDDR Devices

NO.	PARAMETER	MIN	MAX	UNIT	NOTES
1	JEDEC LPDDR Device Speed Grade	LPDDR-266			See Note (1)
2	JEDEC LPDDR Device Bit Width	16	32	Bits	
3	JEDEC LPDDR Device Count	1	2	Devices	See Note (2)
4	JEDEC LPDDR Device Ball Count	60	90	Balls	

(1) Higher LPDDR speed grades are supported due to inherent JEDEC LPDDR backwards compatibility.

(2) 1 x16 LPDDR device is used for 16 bit LPDDR memory system. 1x32 or 2x16 LPDDR devices are used for a 32-bit LPDDR memory system.

6.4.2.1.3 PCB Stackup

The minimum stackup required for routing the DM37x is a six layer stack as shown in Table 6-14. Additional layers may be added to the PCB stack up to accommodate other circuitry or to reduce the size of the PCB footprint.

Table 6-14. DM37x Minimum PCB Stack Up

LAYER	TYPE	DESCRIPTION
1	Signal	Top Routing Mostly Horizontal
2	Plane	Ground
3	Plane	Power
4	Signal	Internal Routing
5	Plane	Ground
6	Signal	Bottom Routing Mostly Vertical

Table 6-15. PCB Stack Up Specifications (4)

NO.	PARAMETER	MIN	TYP	MAX	UNIT	NOTES
1	PCB Routing/Plane Layers	6				
2	Signal Routing Layers	3				
3	Full ground layers under LPDDR routing region	2				
4	Number of ground plane cuts allowed within LPDDR routing region			0		
5	Number of ground reference planes required for each LPDDR routing 1 layer	1				
6	Number of layers between LPDDR routing layer and reference ground 0 plane			0		
7	PCB Routing Feature Size		4		Mils	
8	PCB Trace Width w		4		Mils	
9	PCB BGA escape via pad size		18		Mils	
10	PCB BGA escape via hole size		8		Mils	
11	Device BGA Pad Size					See Note(1)
12	LPDDR Device BGA Pad Size					See Note(2)
13	Single Ended Impedance, ZO	50		75	Ω	
14	Impedance Control	Z-5	Z	Z + 5	Ω	See Note(3)

(1) See the Flip Chip Ball Grid Array Package (SPRU811) reference guide for device BGA pad size.

(2) See the LPDDR device manufacturer documentation for the LPDDR device BGA pad size.

(3) Z is the nominal singled ended impedance selected for the PCB specified by item 12.

(4) Specific routing guidelines for the CUS package can be found in the AM37x CUS Routing Guidelines (SPRABD4) application note.

6.4.2.2 Placement

Figure 6-19 shows the required placement for the DM37x device as well as the LPDDR devices. The dimensions for Figure 6-19 are defined in Table 6-16. The placement does not restrict the side of the PCB that the devices are mounted on. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For 1x16 and 1x32 LPDDR memory systems, the second LPDDR device is omitted from the placement.

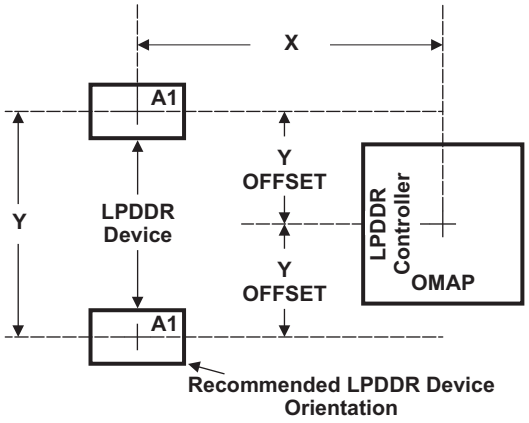

Figure 6-19. DM37xx and LPDDR Device Placement

Table 6-16. Placement Specifications

NO.	PARAMETER	MIN	MAX	UNIT	NOTES
1	X		1440	Mils	See Notes(1), (2)
2	Y		1030	Mils	See Notes(1), (2)
3	Y Offset		525	Mils	See Notes(1),(2),(3)
4	LPDDR Keepout Region				See Note(4)
5	Clearance from non-LPDDR signal to LPDDR Keepout Region	4		w	See Note(5)

(1) See Figure 6-17 for dimension definitions.

(2) Measurements from center of device to center of LPDDR device.

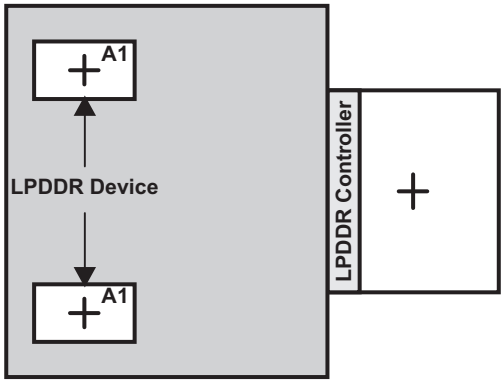
(3) For 16 bit memory systems it is recommended that Y Offset be as small as possible.

(4) LPDDR keepout region to encompass entire LPDDR routing area.

(5) Non-LPDDR signals allowed within LPDDR keepout region provided they are separated from LPDDR routing layers by a ground plane.

6.4.2.3 LPDDR Keep Out Region

The region of the PCB used for the LPDDR circuitry must be isolated from other signals. The LPDDR keep out region is defined for this purpose and is shown in Figure 6-20. The size of this region varies with the placement and LPDDR routing. Additional clearances required for the keep out region are shown in Table 6-16.



Region should encompass all LPDDR circuitry and varies depending on placement. Non-LPDDR signals should not be routed on the LPDDR signal layers within the LPDDR keep out region. Non-LPDDR signals may be routed in the region provided they are routed on layers separated from LPDDR signal layers by a ground layer. No breaks should be allowed in the reference ground layers in this region. In addition, the 1.8 V power plane should cover the entire keep out region.

Figure 6-20. LPDDR Keepout Region

6.4.2.4 Net Classes

Table 6-17 lists the clock net classes for the LPDDR interface. Table 6-18 lists the signal net classes, and associated clock net classes, for the signals in the LPDDR interface. These net classes are used for the termination and routing rules that follow.

Table 6-17. Clock Net Class Definitions

CLOCK NET CLASS	PIN NAMES
CK	sdrc_clk/sdrc_nclk
DQS0	sdrc_dqs0
DQS1	sdrc_dqs1
DQS2	sdrc_dqs2
DQS3	sdrc_dqs3

Table 6-18. Signal Net Class Definitions

CLOCK NET CLASS	ASSOCIATED CLOCK NET CLASS	PIN NAMES
ADDR_CTRL	CK	sdrc_ba[1:0], sdrc_a[14:0], sdrc_ncs[1:0], sdrc_ncas, sdrc_nras, sdrc_nwe, sdrc_cke[1:0]
DQ0	DQS0	sdrc_d[7:0], sdrc_dm0
DQ1	DQS1	sdrc_d[15:8], sdrc_dm1
DQ2	DQS2	sdrc_d[23:16], sdrc_dm2
DQ3	DQS3	sdrc_d[31:24], sdrc_dm3

6.4.2.5 LPDDR Signal Termination

No terminations of any kind are required in order to meet signal integrity and overshoot requirements. Serial terminators are permitted, if desired, to reduce EMI risk; however, serial terminations are the only type permitted. Table 6-19 shows the specifications for the series terminators.

Table 6-19. LPDDR Signal Terminations

NO.	PARAMETER	MIN	TYP	MAX	UNIT	NOTES
1	CK Net Class	0		10	Ω	See Note(1)
2	ADDR_CTRL Net Class	0	22	Zo	Ω	See Notes(1),(2),(3)
3	Data Byte Net Classes (DQS0-DQS3, DQ0-DQ3)	0	22	Zo	Ω	See Notes(1),(2),(3)

(1) Only series termination is permitted, parallel or SST specifically disallowed.

(2) Terminator values larger than typical only recommended to address EMI issues.

(3) Termination value should be uniform across net class.

6.4.2.6 LPDDR CK and ADDR_CTRL Routing

Figure 6-21 shows the topology of the routing for the CK and ADDR_CTRL net classes. The route is a balanced T as it is intended that the length of segments B and C be equal. In addition, the length of A should be maximized.

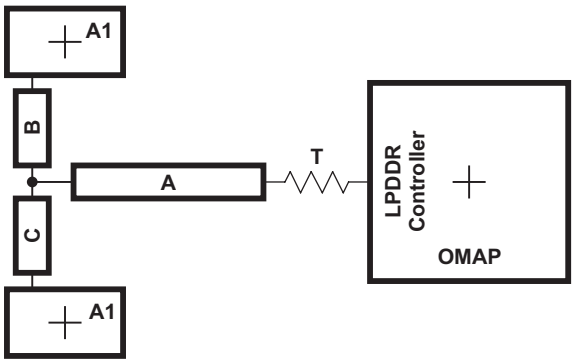


Figure 6-21. CK and ADDR_CTRL Routing and Topology

Table 6-20. CK and ADDR_CTRL Routing Specification (5)

NO.	PARAMETER	MIN	TYP	MAX	UNIT	NOTES
1	Center to Center CK-CK spacing			2w		
2	CK Differential Pair Skew Length Mismatch(4)			25	Mils	See Note(1)
3	CK B to C Skew Length Mismatch			25	Mils	
4	Center to Center CK to other LPDDR trace spacing	4w				See Note(2)
5	CK/ADDR_CTRL nominal trace length	CACLM-50	CACLM	CACLM+50	Mils	See Note(3)
6	ADDR_CTRL to CK Skew Length Mismatch			100	Mils	
7	ADDR_CTRL to ADDR_CTRL Skew Length Mismatch			100	Mils	
8	Center to Center ADDR_CTRL to other LPDDR trace spacing	4w				See Note(2)
9	Center to Center ADDR_CTRL to other ADDR_CTRL trace spacing	3w				See Note(2)
10	ADDR_CTRL A to B, ADDR_CTRL A to C Skew Length Mismatch			100	Mils	See Note(1)
11	ADDR_CTRL B to C Skew Length Mismatch			100	Mils	

(1) Series terminator, if used, should be located closest to DM37x.

(2) Center to center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.

(3) CACLM is the longest Manhattan distance of the CK and ADDR_CTRL net classes.

(4) Differential impedance should be 100 ohms.

(5) Specific routing guidelines for the CUS package can be found in the AM37x CUS Routing Guidelines (SPRABD4) application note.

Figure 6-22 shows the topology and routing for the DQS and DQ net classes; the routes are point to point. Skew matching across bytes is not needed nor recommended.

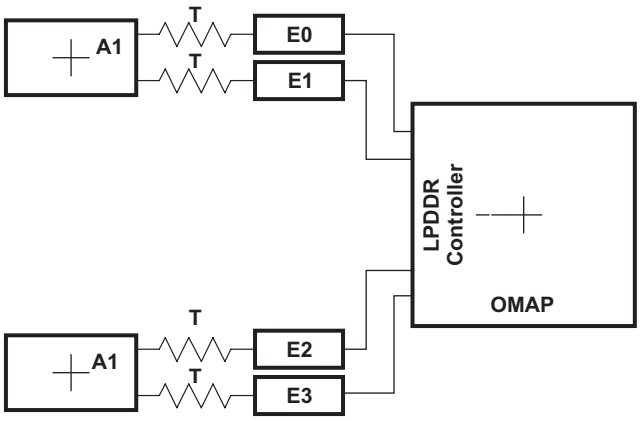

Figure 6-22. DQS and DQ Routing and Topology

Table 6-21. DQS and DQ Routing Specification(1) (6)

PARAMETER	MIN	TYP	MAX	UNIT	NOTES
DQS E Skew Length Mismatch			25	Mils	
Center to Center DQS to other LPDDR trace spacing	4w				See Note(2)
DQS/DQ nominal trace length	DQLM - 50	DQLM	DQLM + 50	Mils	See Note(2)
DQ to DQS Skew Length Mismatch			100	Mils	See Note (4)
DQ to DQ Skew Length Mismatch			100	Mils	See Note (4)
Center to Center DQ to other LPDDR trace spacing	4w				See Note(5)
Center to Center DQ to other DQ trace spacing	3w				See Note(2),(3)
DQ E Skew Length Mismatch			100	Mils	

(1) Series terminator, if used, should be located closest to LPDDR.

(2) Center to center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.

(3) DQLM is the longest Manhattan distance of the DQS and DQ net classes.

(4) There is no need, and it is not recommended, to skew match across data bytes. This specification is only relative within a data byte.

(5) DQs from other bytes are considered *other* LPDDR traces.

(6) Specific routing guidelines for the CUS package can be found in the AM37x CUS Routing Guidelines (SPRABD4) application note.

6.5 Multimedia Interfaces

6.5.1 Camera ISP2P Interface

NOTE

For more information, see Camera ISP chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

The camera subsystem provides the system interfaces and the processing capability to connect raw, YUV or JPEG image sensor modules to the device for video-preview, video-record and still-image-capture applications.

The camera ISP2P subsystem supports up to two simultaneous pixel flows but only one of them can use the video processing hardware:

- Parallel camera interface + Serial camera interface: one interface data goes through the video processing hardware. The other interface data goes directly to memory
- Serial camera interface + Serial camera interface: one serial interface data goes through the video processing hardware. The other serial interface data goes directly to memory.

The camera ISP2P subsystem supports different camera configurations:

- 10-bit Parallel interface
- 12-bit Parallel interface
- 12-bit Parallel interface

Note: For more information, see the Camera ISP / Camera ISP Environment / Camera ISP Connectivity Schemes section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

6.5.1.1 Camera Output Clocks (cam_xclka and cam_xclkb)

Table 6-22. ISP2P cam_xclka and cam_xclkb Output Clocks Switching Characteristics

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
ISP15	$1 / t_{c(xclk)}$	Frequency(1), output clock cam_xclkn(4)		216		216	MHz
ISP16	$t_{w(xclkH)}$	Typical pulse duration, output clock cam_xclkn(4) high	0.5P(2)		0.5P(2)		ns
ISP16	$t_{w(xclkL)}$	Typical pulse duration, output clock cam_xclkn(4) low	0.5P(2)		0.5P(2)		ns
	$t_{dc(xclk)}$	Duty cycle error, output clock cam_xclkn(4)		0.5 * P(2) - 2.083		0.5 * P(2) - 2.083	ps
	$t_{J(xclk)}$	Cycle jitter(3), output clock cam_xclkn(4)		0.044 * P(2)		0.044 * P(2)	ps
	$t_{R(xclk)}$	Rise time, output clock cam_xclkn(4)		0.93		0.93	ns
	$t_{F(xclk)}$	Fall time, output clock cam_xclkn(4)		0.93		0.93	ns

(1) Related with the cam_xclkn(4) maximum and minimum frequencies programmable in the ISP module.
NOTE: You must disable the camera sensor or the camera module to change the frequency configuration. For more information, see the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(2) P = cam_xclkn(4) period in ns

(3) Maximum cycle jitter supported by cam_xclka and cam_xclkb output clocks.

(4) In cam_xclkn, n is equal to a or b.

6.5.1.2 Parallel Camera Interface (CPI)

6.5.1.2.1 CPI—Video and Graphics Digitizer 1.8V Mode

The imaging subsystem deals with the processing of the pixel data coming from an external image sensor or from video and graphics digitizer. It is a key component for the following multimedia applications: video preview, camera viewfinder, video record and still image capture. It supports RAW, RGB, and YUV data processing.

Table 6-24 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-23 and Figure 6-24).

Table 6-23. CPI Timing Conditions—Video and Graphics Digitizer 1.8-V Mode

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	80	1800	ps
t_F	Input signal fall time	80	1800	ps

Table 6-24. CPI Timing Requirements—Video and Graphics Digitizer 1.8-V Mode(4) (6)

NO.	PARAMETER		OPP100		UNIT
			MIN	MAX	
ISP1	$1 / t_{c(pclk)}$	Frequency(1), input pixel clock cam_pclk		148.5	MHz
ISP2	$t_{w(pclkL)}$	Typical pulse duration, input pixel clock cam_pclk low	0.5P(2)		ns
ISP3	$t_{w(pclkH)}$	Typical pulse duration, input pixel clock cam_pclk high	0.5P(2)		ns
	$t_{dc(pclk)}$	Duty cycle error, input pixel clock cam_pclk		0.5*P(2) - 3.247	ns
	$t_{J(pclk)}$	Cycle jitter(3), input pixel clock cam_pclk		0.06P(2)	ns
ISP4	$t_{su(vsV-pclkH)}$	Setup time, input vertical synchronization cam_vs valid before input pixel clock cam_pclk rising/falling edge	0.75		ns
ISP5	$t_{h(pclkH-vsV)}$	Hold time, input vertical synchronization cam_vs valid after input pixel clock cam_pclk rising/falling edge	0.96		ns
ISP6	$t_{su(hsV-pclkH)}$	Setup time, input horizontal synchronization cam_hs valid before input pixel clock cam_pclk rising/falling edge	0.75		ns
ISP7	$t_{h(pclkH-hsV)}$	Hold time, input horizontal synchronization cam_hs valid after input pixel clock cam_pclk rising/falling edge	0.96		ns
ISP8	$t_{su(dV-pclkH)}$	Setup time, input data cam_d[n:0](5) valid before input pixel clock cam_pclk rising/falling edge	0.75		ns
ISP9	$t_{h(pclkH-dV)}$	Hold time, input data cam_d[n:0](5) valid after input pixel clock cam_pclk rising/falling edge	0.96		ns
ISP10	$t_{su(wenV-pclkH)}$	Setup time, input write enable cam_wen valid before input pixel clock cam_pclk rising/falling edge	0.75		ns
ISP11	$t_{h(pclkH-wenV)}$	Hold time, input write enable cam_wen valid after input pixel clock cam_pclk rising/falling edge	0.96		ns
ISP12	$t_{su(fldV-pclkH)}$	Setup time, input field identification cam_fld valid before input pixel clock cam_pclk rising/falling edge	0.75		ns
ISP13	$t_{h(pclkH-fldV)}$	Hold time, input field identification cam_fld valid after input pixel clock cam_pclk rising/falling edge	0.96		ns

(1) Related with the input maximum frequency supported by the ISP module in 8-bit mode with 8 to 16 data bits conversion bridge enabled.

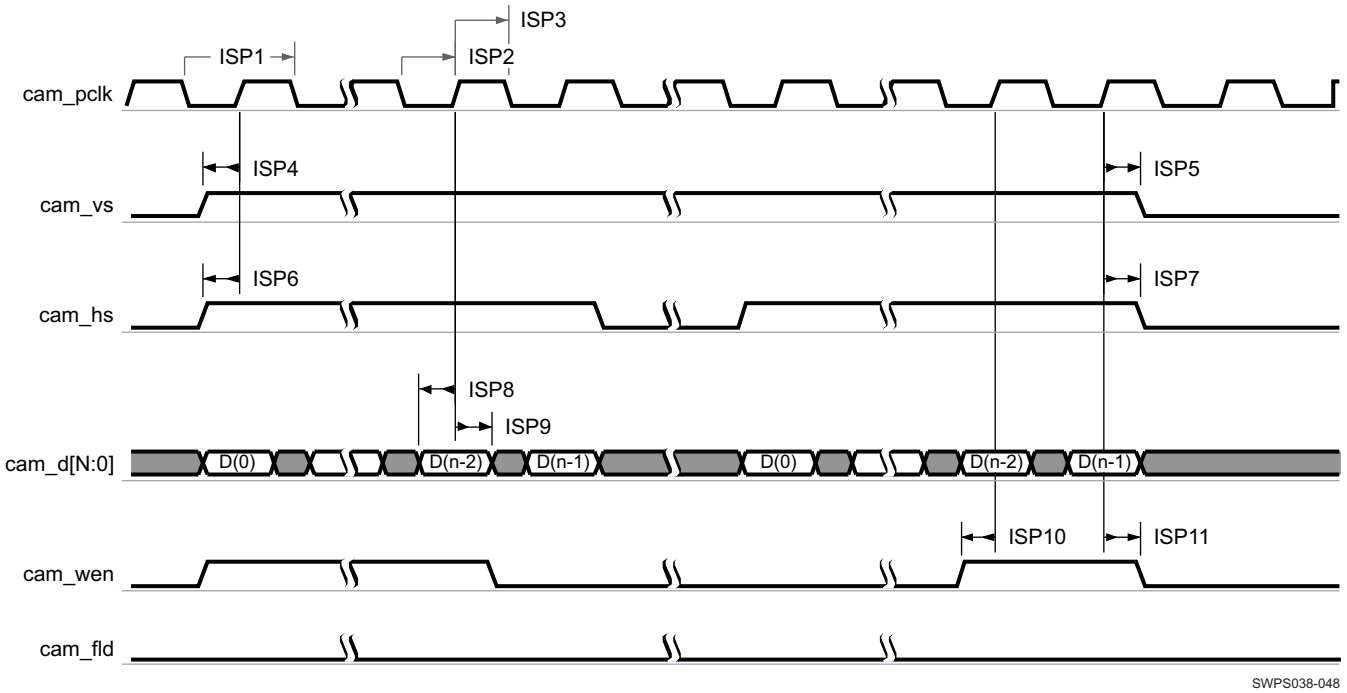
(2) P = cam_pclk period in ns

(3) Maximum cycle jitter supported by cam_pclk input clock

(4) The timing requirements are assured up to the cycle jitter and duty cycle error conditions specified.

(5) n = 11 (Data bus size is limited to 8 bits. So the bits configuration is either cam_d[7:0] or cam_d[11:4]). Lines not connected must be tied low.

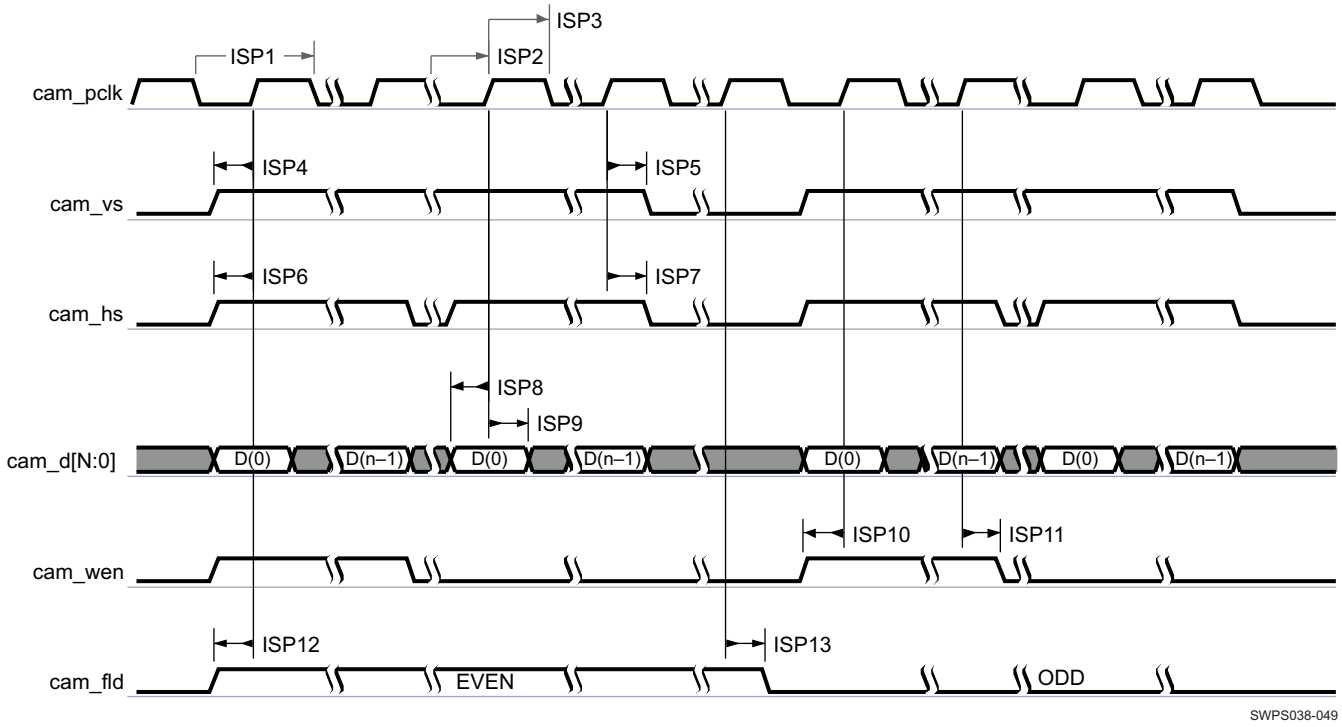
(6) See Section 4.3.4, *Processor Clocks*.



(1) The polarity of cam_pclk, cam_fld, cam_vs, and cam_hs are software configurable. Optionally, the cam_wen signal can be used as an external memory write-enable signal. For further details, see the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(2) N = 11 (Data bus size is limited to 8 bits. So the bits configuration is either cam_d[7:0] or cam_d[11:4]). When the number of data lines is less than cam_d[N:0], data lines can be connected to the upper or lower lines of cam_d[N:0]. Lines not connected must be tied low. For more information about video port mapping, see the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Figure 6-23. CPI—Video and Graphics Digitizer—1.8-V Progressive Mode



(1) The polarity of cam_pclk, cam_fld, cam_vs, and cam_hs are software configurable. Optionally, the cam_wen signal can be used as an external memory write-enable signal. For further details, see the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(2) N = 11 (Data bus size is limited to 8 bits. So the bits configuration is either cam_d[7:0] or cam_d[11:4]). When the number of data lines is less than cam_d[N:0], data lines can be connected to the upper or lower lines of cam_d[N:0]. Lines not connected must be tied low. For more information about video port mapping, see the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Figure 6-24. CPI—Video and Graphics Digitizer—1.8-V Interlaced Mode

6.5.1.2.2 CPI—12-Bit SYNC Normal Progressive Mode

Table 6-26 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-25).

Table 6-25. CPI Timing Conditions—12-Bit SYNC Normal Progressive Mode(1)

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	2.7	ns
t_F	Input signal fall time	2.7	ns
Output Condition			
C_{LOAD}	Output load capacitance	8.6	pF

(1) The load setting of the IO buffer: LB0 = 1.

Table 6-26. CPI Timing Requirements—12-Bit SYNC Normal Progressive Mode(4) (5)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
ISP17	$1 / t_{c(pclk)}$	Frequency(1), input pixel clock cam_pclk		75		45	MHz
ISP18	$t_{w(pclkH)}$	Typical pulse duration, input pixel clock cam_pclk high	0.5P(2)		0.5P(2)		ns
ISP18	$t_{w(pclkL)}$	Typical pulse duration, input pixel clock cam_pclk low	0.5P(2)		0.5P(2)		ns
	$t_{dc(pclk)}$	Duty cycle error, input pixel clock cam_pclk		0.5P(2) - 3.465		0.5P(2) - 6.93	ns
	$t_{J(pclk)}$	Cycle jitter(3), input pixel clock cam_pclk		0.0649*P (2)		0.0649*P (2)	ns
ISP19	$t_{su(dV-pclkH)}$	Setup time, input data cam_d[11:0] valid before input pixel clock cam_pclk rising edge	1.82		3.25		ns
ISP20	$t_{h(pclkH-dV)}$	Hold time, input data cam_d[11:0] valid after input pixel clock cam_pclk rising edge	1.82		3.25		ns
ISP21	$t_{su(dV-vsH)}$	Setup time, input vertical synchronization cam_vs valid before input pixel clock cam_pclk rising edge	1.82		3.25		ns
ISP22	$t_{h(pclkH-vsV)}$	Hold time, input vertical synchronization cam_vs valid after input pixel clock cam_pclk rising edge	1.82		3.25		ns
ISP23	$t_{su(dV-hsH)}$	Setup time, input horizontal synchronization cam_hs valid before input pixel clock cam_pclk rising edge	1.82		3.25		ns
ISP24	$t_{h(pclkH-hsV)}$	Hold time, input horizontal synchronization cam_hs valid after input pixel clock cam_pclk rising edge	1.82		3.25		ns
ISP25	$t_{su(dV-hsH)}$	Setup time, input write enable cam_wen valid before input pixel clock cam_pclk rising edge	1.82		3.25		ns
ISP26	$t_{h(pclkH-hsV)}$	Hold time, input write enable cam_wen valid after input pixel clock cam_pclk rising edge	1.82		3.25		ns

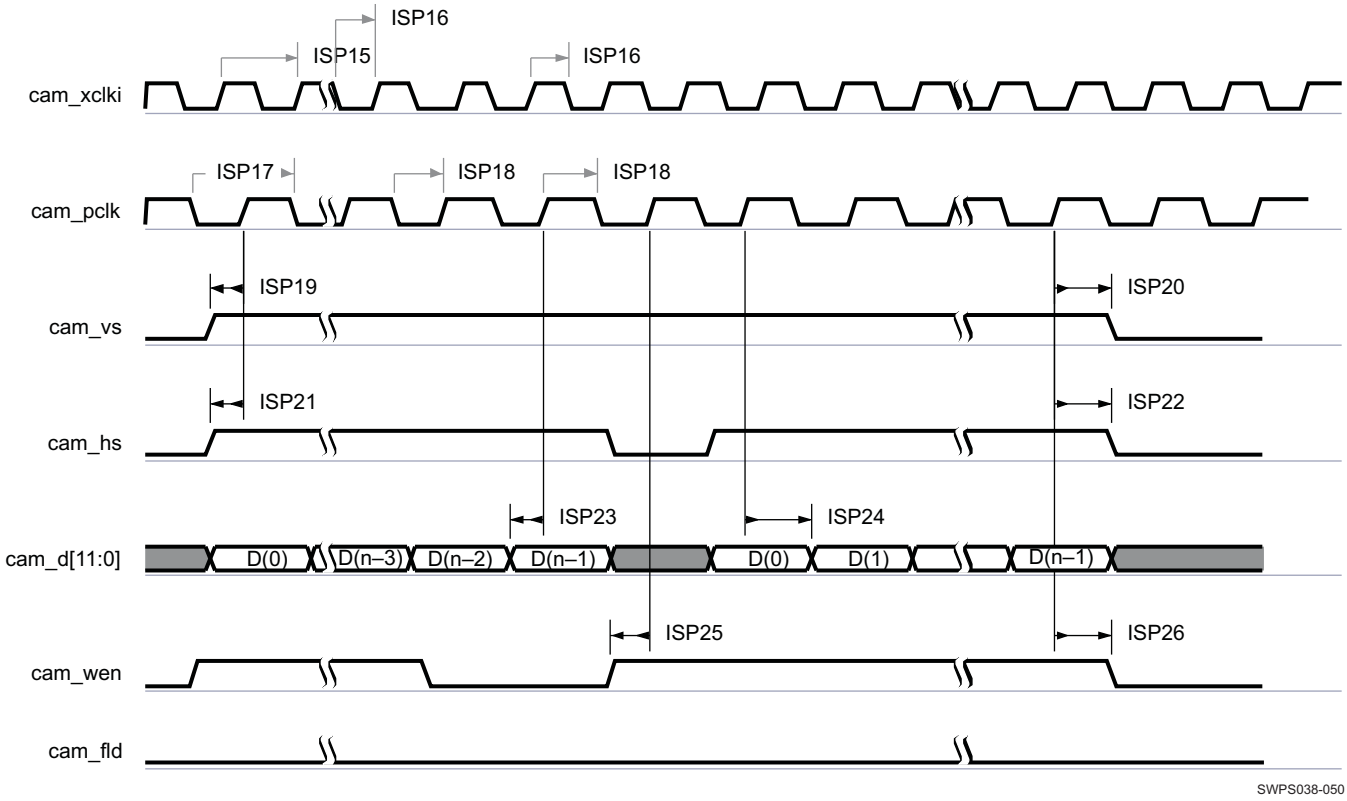
(1) Related with the input maximum frequency supported by the ISP module.

(2) P = cam_pclk period in ns

(3) Maximum cycle jitter supported by cam_pclk input clock.

(4) The timing requirements are assured up to the cycle jitter and duty cycle error conditions specified.

(5) See Section 4.3.4, *Processor Clocks*.



(1) The polarity of cam_pclk, cam_fld, cam_vs, and cam_hs are configurable. If the cam_hs, cam_vs, and cam_fld signals are output, the signal length can be set.
(2) The parallel camera in SYNC mode supports progressive image sensor modules and 8-, 10-, 11-, or 12-bit data.
(3) When the image sensor has fewer than 12 data lines, it must be connected to the lower data lines and the unused lines must be grounded.
(4) However, it is possible to shift the data to 0, 2, or 4 data internal lanes.
(5) The bit configurations are: cam_d[11:4] or cam_d[7:0] in 8-bit mode, cam_d[11:2] or cam_d[9:0] in 10-bit mode, cam_d[10:0] in 11-bit mode and cam_d[11:0] in 12-bit mode.
(6) Optionally, the data write to memory can be qualified by the external cam_wen signal.
(7) The cam_wen signal can be used as an external memory write-enable signal. The data is stored to memory only if cam_hs, cam_vs, and cam_wen signals are asserted.
(8) In cam_xclki, i can be equal to a or b. See Table 6-22 for ISP15 and ISP16 parameters.

Figure 6-25. CPI—12-Bit SYNC Normal Progressive Mode

6.5.1.2.3 CPI—8-Bit SYNC Packed Progressive Mode

Table 6-28 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-26).

Table 6-27. CPI Timing Conditions—8-Bit SYNC Packed Progressive Mode(1)

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	2.5	ns
t_F	Input signal fall time	2.5	ns
Output Condition			
C_{LOAD}	Output load capacitance	8.6	pF

(1) The load setting of the IO buffer: LB0 = 1.

Table 6-28. CPI Timing Requirements—8-Bit SYNC Packed Progressive Mode[4] [5]

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
ISP3	$1 / t_{c(pclk)}$	Frequency [1], input pixel clock cam_pclk		130		65	MHz
ISP4	$t_{w(pclkH)}$	Typical pulse duration, input pixel clock cam_pclk high	0.5*P[2]		0.5*P[2]		ns
ISP4	$t_{w(pclkL)}$	Typical pulse duration, input pixel clock cam_pclk low	0.5*P[2]		0.5*P[2]		ns
	$t_{dc(pclk)}$	Duty cycle error, input pixel clock cam_pclk		0.5*P[2] - 3.465		0.5*P[2] - 6.93	ns
	$t_{J(pclk)}$	Cycle jitter[3], input pixel clock cam_pclk		0.0649*P[2]		0.0649*P[2]	ns
ISP5	$t_{su(dV-pclkH)}$	Setup time, input data cam_d[7:0] valid before input pixel clock cam_pclk rising edge	1.08		2.27		ns
ISP6	$t_{h(pclkH-dV)}$	Hold time, input data cam_d[7:0] valid after input pixel clock cam_pclk rising edge	1.08		2.27		ns
ISP7	$t_{su(dV-vsH)}$	Setup time, input vertical synchronization cam_vs valid before input pixel clock cam_pclk rising edge	1.08		2.27		ns
ISP8	$t_{h(pclkH-vsV)}$	Hold time, input vertical synchronization cam_vs valid after input pixel clock cam_pclk rising edge	1.08		2.27		ns
ISP9	$t_{su(dV-hsH)}$	Setup time, input horizontal synchronization cam_hs valid before input pixel clock cam_pclk rising edge	1.08		2.27		ns
ISP10	$t_{h(pclkH-hsV)}$	Hold time, input horizontal synchronization cam_hs valid after input pixel clock cam_pclk rising edge	1.08		2.27		ns
ISP11	$t_{su(dV-hsH)}$	Setup time, input write enable cam_wen valid before input pixel clock cam_pclk rising edge	1.08		2.27		ns
ISP12	$t_{h(pclkH-hsV)}$	Hold time, input write enable cam_wen valid after input pixel clock cam_pclk rising edge	1.08		2.27		ns

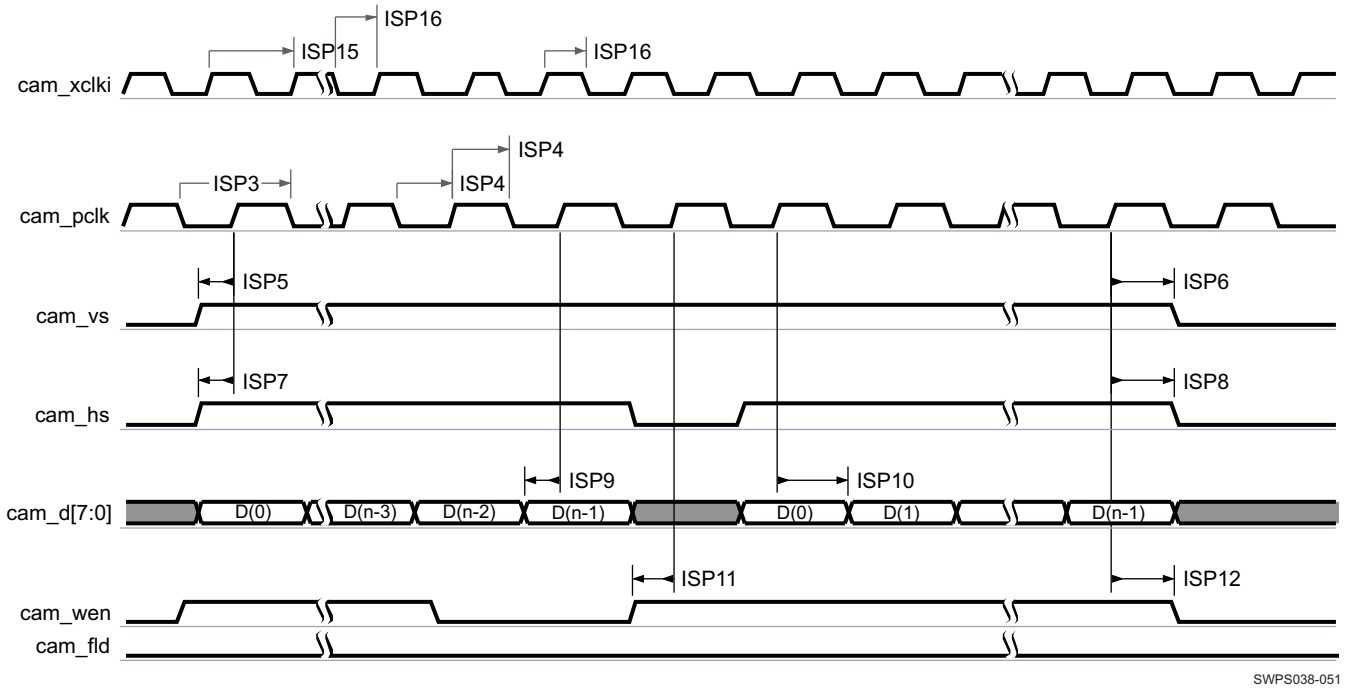
(1) Related with the input maximum frequency supported by the ISP module.

(2) P = cam_pclk period in ns

(3) Maximum cycle jitter supported by cam_pclk input clock.

(4) The timing requirements are assured up to the cycle jitter and duty cycle error conditions specified.

(5) See Section 4.3.4, *Processor Clocks*.



(1) The polarity of cam_pclk, cam_fld, cam_vs, and cam_hs are configurable.

(2) The image sensor is connected to the lower data lines and the unused lines are grounded. However, it is possible to shift the data to 0, 2, or 4 data internal lanes. The bit configurations are: cam_d[11:4] or cam_d[7:0] in 8-bit packed mode.

(3) Optionally, the data write to memory can be qualified by the external cam_wen signal. The cam_wen signal can be used as a external memory write-enable signal. The data is stored to memory only if cam_hs, cam_vs, and cam_wen signals are asserted. The polarity of cam_fld is programmable.

(4) The camera module can pack 8-bit data into 16 bits. It doubles the maximum pixel clock. This mode can be particularly useful to transfer an YCbCr data stream or compressed stream to memory at very high speed.

(5) In cam_xclki, i can be equal to a or b. See Table 6-22 for ISP15 and ISP16 parameters.

Figure 6-26. CPI—8-Bit SYNC Packed Progressive Mode

6.5.1.2.4 CPI—12-Bit SYNC Normal Interlaced Mode

Table 6-30 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-27).

Table 6-29. CPI Timing Conditions—12-Bit SYNC Normal Interlaced Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	2.7	ns
t_F	Input signal fall time	2.7	ns
Output Condition			
C_{LOAD}	Output load capacitance(1)	8.6	pF

(1) The load setting of the IO buffer: LB0 = 1.

ISP28	$t_{h(pclkH-fldV)}$	Hold time, input field identification cam_fld valid after input pixel clock cam_pclk rising edge	1.82		3.25		ns

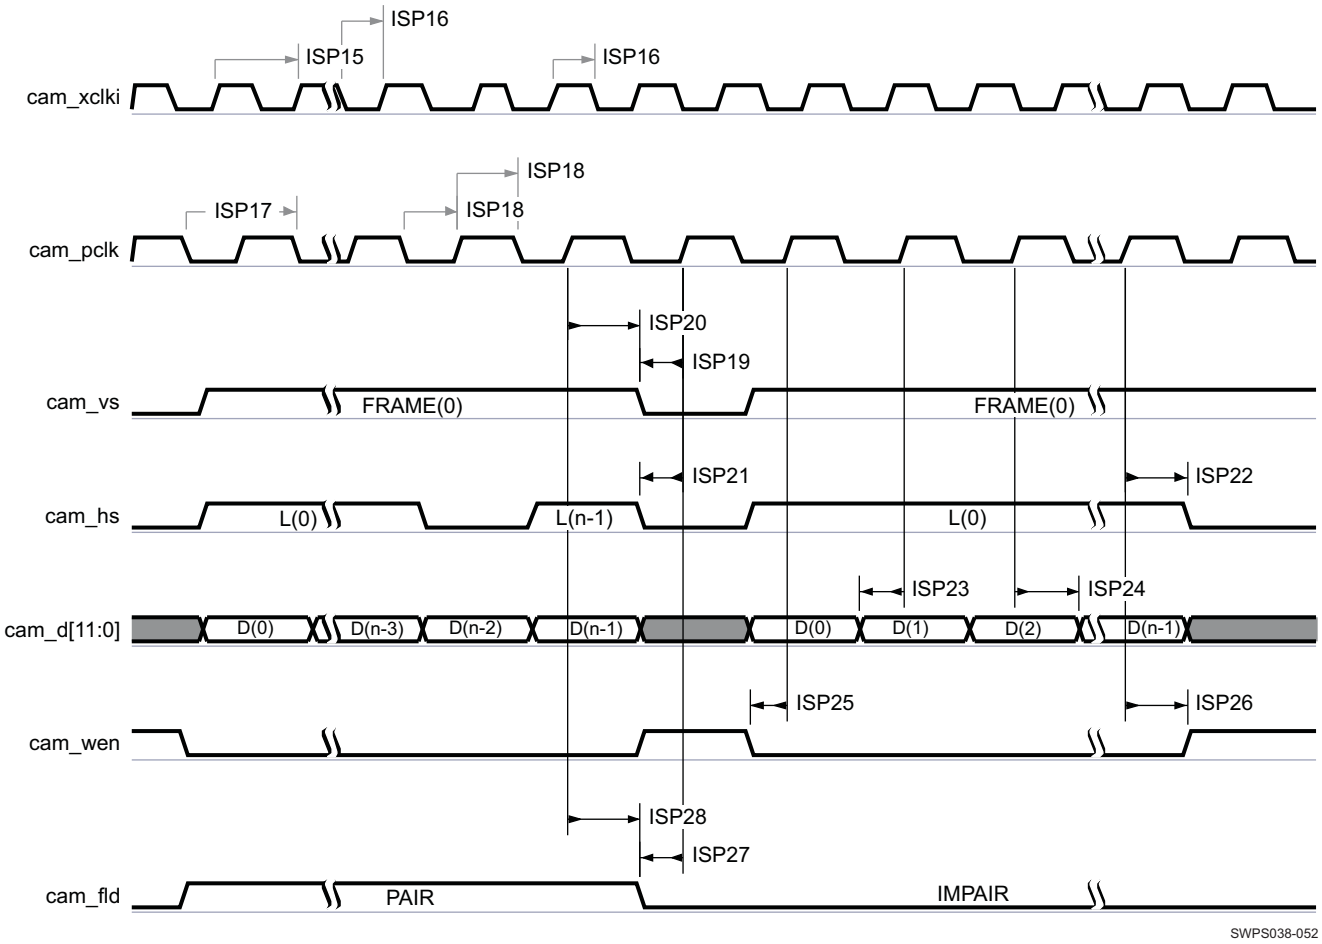
(1) Related with the input maximum frequency supported by the ISP module.

(2) P = cam_pclk period in ns

(3) Maximum cycle jitter supported by cam_pclk input clock.

(4) The timing requirements are assured up to the cycle jitter and duty cycle error conditions specified.

(5) See Section 4.3.4, *Processor Clocks*.



(1) The polarity of cam_pclk, cam_fld, cam_vs, and cam_hs are configurable. If the cam_hs, cam_vs, and cam_fld signals are output, the signal length can be set.

(2) The parallel camera in SYNC mode supports interlaced image sensor modules and 8-, 10-, 11-, or 12-bit data.

(3) When the image sensor has fewer than 12 data lines, it is connected to the lower data lines and the unused lines are grounded.

(4) It is possible to shift the data to 0, 2, or 4 data internal lanes.

(5) The bit configurations are: cam_d[11:4] or cam_d[7:0] in 8-bit mode, cam_d[11:2] or cam_d[9:0] in 10-bit mode, cam_d[10:0] in 11-bit mode and cam_d[11:0] in 12-bit mode.

(6) Optionally, the data write to memory can be qualified by the external cam_wen signal.

(7) The cam_wen signal can be used as an external memory write-enable signal. The data is stored to memory only if cam_hs, cam_vs, and cam_wen signals are asserted.

(8) In cam_xclki, i can be equal to a or b. See Table 6-22 for ISP15 and ISP16 parameters.

6.5.1.2.6 CPI—ITU Mode

Table 6-34 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-29).

Table 6-33. CPI Timing Conditions—ITU Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	2.7	ns
t_F	Input signal fall time	2.7	ns
Output Condition			
C_{LOAD}	Output load capacitance(1)	8.6	pF

(1) The load setting of the IO buffer: LB0 = 1.

Table 6-34. CPI Timing Requirements—ITU Mode(4) (5)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
ISP17	$1 / t_{c(pclk)}$	Frequency(1), input pixel clock cam_pclk		75		45	MHz
ISP18	$t_{w(pclkH)}$	Typical pulse duration, input pixel clock cam_pclk high	0.5P(2)		0.5P(2)		ns
ISP18	$t_{w(pclkL)}$	Typical pulse duration, input pixel clock cam_pclk low	0.5P(2)		0.5P(2)		ns
	$t_{dc(pclk)}$	Duty cycle error, input pixel clock cam_pclk		0.5*P(2) - 3.465		0.5*P(2) - 6.93	ns
	$t_{J(pclk)}$	Cycle jitter(3), input pixel clock cam_pclk		0.0649*P(2)		0.0649*P(2)	ns
ISP23	$t_{su(dV-pclkH)}$	Setup time, input data cam_d[9:0] valid before input pixel clock cam_pclk rising edge	1.82		3.25		ns
ISP24	$t_{h(pclkH-dV)}$	Hold time, input data cam_d[9:0] valid after input pixel clock cam_pclk rising edge	1.82		3.25		ns

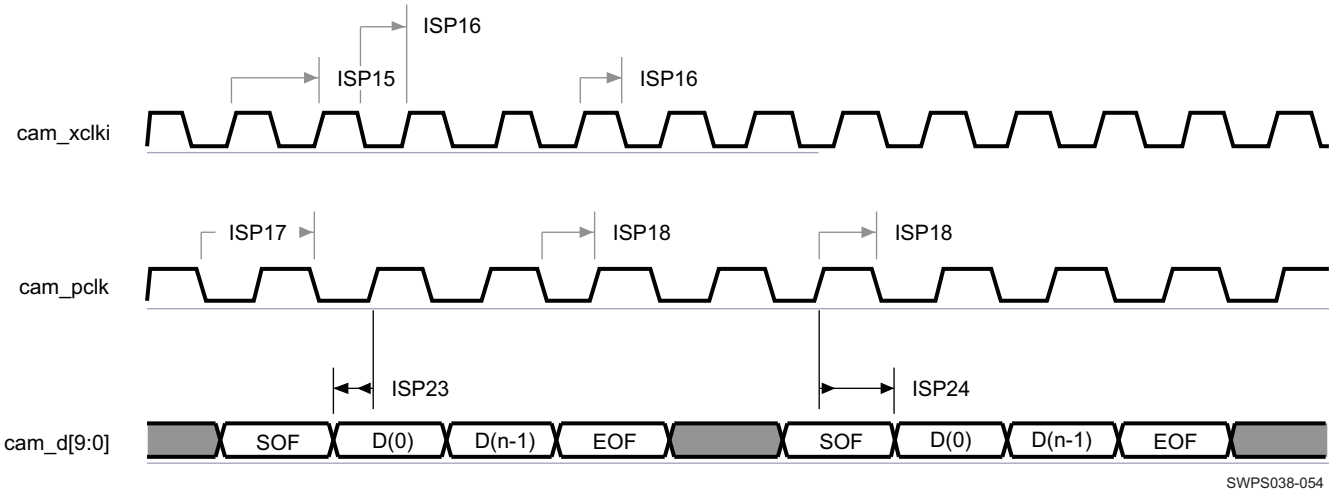
(1) Related with the input maximum frequency supported by the ISP module.

(2) P = cam_pclk period in ns

(3) Maximum cycle jitter supported by cam_pclk input clock.

(4) The timing requirements are assured up to the cycle jitter and duty cycle error conditions specified.

(5) See Section 4.3.4, *Processor Clocks*.



(1) The unused lines are grounded and the data bus is connected to the lower data lines. However, it is possible to shift the data to 0, 2, or 4 data internal lanes. The different configurations are: cam_d[11:4] or cam_d[7:0] in 8-bit mode and cam_d[11:2] or cam_d[9:0] in 10-bit mode.

(2) The parallel camera in ITU mode supports progressive camera modules.

(3) In cam_xclki, i can be equal to a or b. See Table 6-22 for ISP15 and ISP16 parameters.

Figure 6-29. CPI—ITU Mode

6.5.2 Display Subsystem (DSS)

NOTE

For more information, see Display Subsystem chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

The display subsystem (DSS) provides the logic to display the video frame from external (SDRAM) or internal (SRAM) memory on an LCD panel or a TV set. The display subsystem integrates the following elements:

- Display controller (DISPC) module
- Remote frame buffer interface (RFBI) module
- NTSC/PAL video encoder
- LCD display with:
  - Parallel Interface

The two display supports can be active at the same time.

6.5.2.1 DSS—Parallel Interface

In parallel interface, the paths of the display subsystem modules are the display controller and the RFBI. The display controller has two I/O pad modes and could be in the following configuration:

- Bypass mode (RFBI disabled), which implements the MIPI DPI protocol
- RFBI mode (RFBI enabled), which implements MIPI DBI 2.0 type B protocol

For more information about MIPI DPI and MIPI DBI protocols, see the DSS chapter in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

6.5.2.1.1 DSS—Parallel Interface—Bypass Mode

Two types of LCD panel are supported:

- Thin film transistor (TFT) or active matrix technology
- Supertwisted nematic (STN) or passive matrix technology

Both configurations are discussed in the following paragraphs.

6.5.2.1.2 DSS—Parallel Interface—Bypass Mode—TFT Mode

Table 6-36 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-30).

Table 6-35. DSS Timing Conditions—TFT Mode

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Output Condition				
C_{LOAD}	Output load capacitance(1)		10	pF

(1) Buffer strength configuration: LB0 = 1

Table 6-36. DSS Switching Characteristics—TFT Mode(4)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
DL0	$t_{d(pclkA\text{-}hsync)}$	Delay time, output pixel clock dss_pclk active edge to output horizontal synchronization dss_hsync transition	–4.215	4.215	–4.658	4.658	ns
DL1	$t_{d(pclkA\text{-}vsync)}$	Delay time, output pixel clock dss_pclk active edge to output vertical synchronization dss_vsync transition	–4.215	4.215	–4.658	4.658	ns

Table 6-36. DSS Switching Characteristics—TFT Mode[4] (continued)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
DL2	$t_{d(pclkA-acbiasA)}$	Delay time, output pixel clock dss_pclk active edge to output data enable dss_acbias active level	–4.215	4.215	–4.658	4.658	ns
DL3	$t_{d(pclkA-dV)}$	Delay time, output pixel clock dss_pclk active edge to output data dss_data[23:0] valid	–4.215	4.215	–4.658	4.658	ns
DL4	$1 / t_{c(pclk)}$	Frequency[2], output pixel clock dss_pclk		74.3[3]		66[3]	MHz
DL5	$t_{w(pclk)}$	Pulse duration, output pixel clock dss_pclk low or high	0.45P[1]	0.55P[1] [5]	0.45P[1]	0.55P[1] [5]	ns

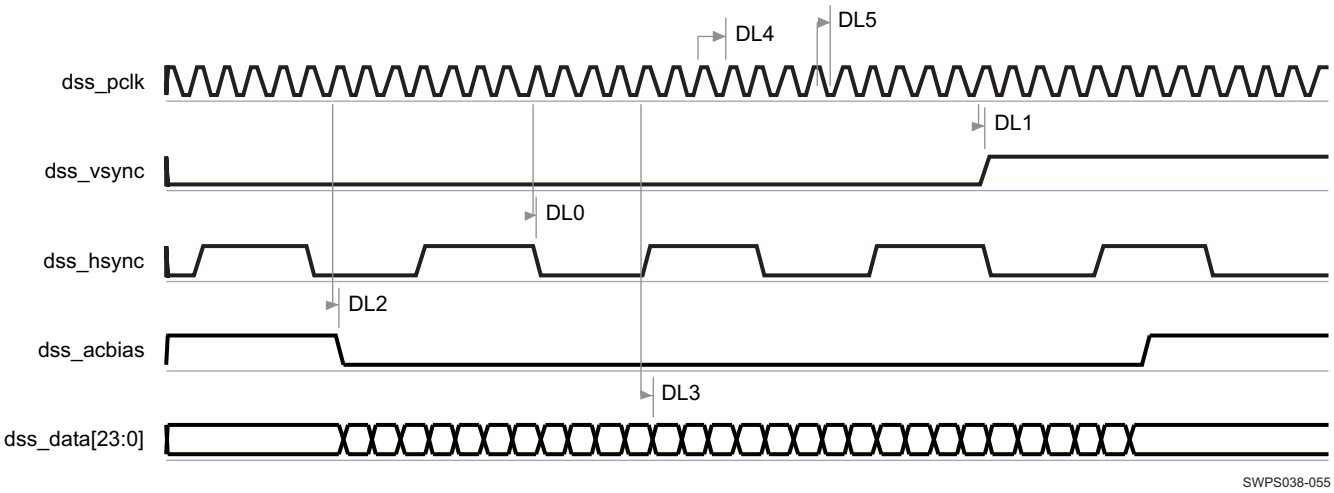
(1) P = dss_pclk period in ns

(2) The pixel clock frequency is software programmable via the pixel clock divider configuration from 1 to 255 division range in the DISPC_DIVISOR register.

(3) For the DSS (TFT mode) in HD-TV application, to run at full speed (74.3 MHz) it is recommended to use the dss_data[5:0] signals on the dss_data[23:18] balls (H26, H25, E28, J26, AC27, AC28). In that case, the dss_data[23:18] signals are available on the sys_boot0, sys_boot1, sys_boot3, sys_boot4, sys_boot5, and sys_boot6 balls (AH26, AG26, AF18, AF19, AE21, AF21) to run at full speed (74.3 MHz).
If the dss_data[5:0] signals are used on the dss_data[5:0] balls (AG22, AH22, AG23, AH23, AG24, AH24), OPP100 DSS (TFT mode) are limited at 66 MHz. The values may change following the silicon characterization result.

(4) See Section 4.3.4, *Processor Clocks*.

(5) tW(pclk) = 0.66.P when DISPC_DIVISOR[6:0] PCD = 3.



(1) The pixel data bus depends on the use of 8-, 9-, 12-, 16-, 18-, or 24-bit per pixel data output pins.

(2) The pixel clock frequency is programmable.

(3) All timings not illustrated in the waveform are progammable by software, and control signal polarity and driven edge of dss_pclk too.

(4) For more information, see the DSS chapter in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Figure 6-30. DSS—TFT Mode

6.5.2.1.3 DSS—Parallel Interface—Bypass Mode—STN Mode

Table 6-38 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-31).

Table 6-37. DSS Timing Conditions—STN Mode

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Output Condition				
C_{LOAD}	Output load capacitance[1]		40	pF

(1) Buffer strength configuration: LB0 = 1

Table 6-38. DSS Switching Characteristics—STN Mode(3) (4)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
DL3	$t_{d(pclkA-dV)}$	Delay time, output pixel clock dss_pclk active edge to output data dss_data[7:0] valid	–6.868	6.868	–6.868	6.868	ns
DL4	$1 / t_{c(pclk)}$	Frequency(2), output pixel clock dss_pclk		44		44	MHz
DL5	$t_{w(pclk)}$	Pulse duration, output pixel clock dss_pclk low or high	0.45P(1)	0.55P(1) (5)	0.45P(1)	0.55P(1)(5)	ns

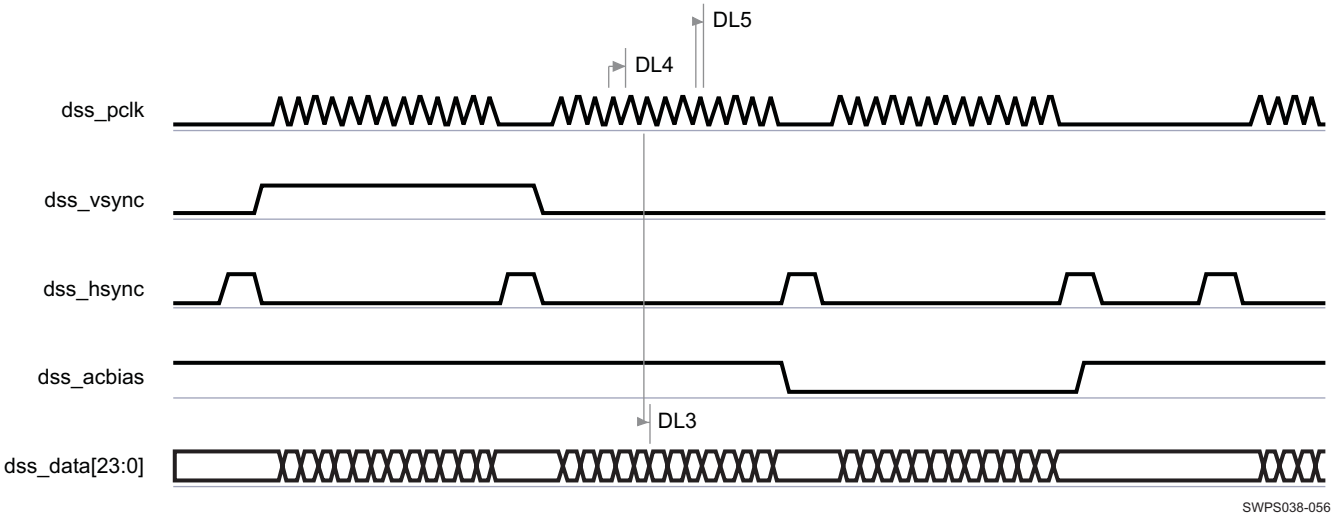
(1) P = dss_pclk period in ns

(2) The pixel clock frequency is software programmable via the pixel clock divider configuration from 1 to 255 division range in the DISPC_DIVISOR register.

(3) The DSS in STN mode is used with 4 or 8 pins only; unused pixel data bits always remain low.

(4) See Section 4.3.4, *Processor Clocks*.

(5) tW(pclk) = 0.66P when DISPC_DIVISOR[6:0] PCD = 3.



(1) The pixel data bus depends on the use of 4-, 8-, 12-, 16-, 18-, or 24-bit per pixel data output pins.

(2) All timings not illustrated in the waveform are progammable by software, and control signal polarity and driven edge of dss_pclk too.

(3) dss_vsync width must be programmed to be as small as possible.

(4) The pixel clock frequency is programmable.

(5) For more information, see the DSS chapter in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

6.5.2.2.2 DSS—Parallel Interface—RFBI Mode—Pico DLP

The Remote Frame Buffer Interface (RFBI) module can provide also the necessary control signals and data to interface to the Pico DLP driver of the Pico DLP panel. Table 6-42 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-35).

Table 6-42. DSS Timing Conditions—RFBI Mode—Pico DLP

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Output Condition				
C_{LOAD}	Output load capacitance(1)		5	pF

(1) Buffer strength configuration: LB0 = 0

To use Pico DLP application, RFBI register must be configured as shown in Table 6-43:

Table 6-43. DSS Register Configuration—RFBI Mode—Pico DLP

DESCRIPTION	REGISTER AND BIT FIELD(1)	BIT	VALUES
Selection parallel mode	RFBI_CONFIGi and ParallelMode	[1:0]	0b11: 16-bit parallel output interface selected
Time Granularity (multiplies signal timing latencies by 2).	RFBI_CONFIGi andTimeGranularity	[4]	0b0: x2 latency disable
CS signal assertion time from Start Access Time	RFBI_ONOFF_TIMEi and CSOnTime	[3:0]	0b0000
CS signal de-assertion time from Start Access Time	RFBI_ONOFF_TIMEi and CSOffTime	[9:4]	0b000100: 4 cycles
WE signal assertion time from Start Access Time	RFBI_ONOFF_TIMEi and WEOnTime	[13:10]	0b0000
WE signal de-assertion time from Start Access Time	RFBI_ONOFF_TIMEi and WEOffTime	[19:14]	0b000010: 2 cycles
RE signal assertion time from Start Access Time	RFBI_ONOFF_TIMEi and REOnTime	[23:20]	0b0000
RE signal de-assertion time from Start Access Time	RFBI_ONOFF_TIMEi and REOffTime	[29:24]	0b000000
Write cycle time	RFBI_CYCLE_TIMEi and WECycleTime	[5:0]	0b000100: 4 cycles
Read cycle time	RFBI_CYCLE_TIMEi and ReCycleTime	[11:6]	0b000000
CS pulse width	RFBI_CYCLE_TIMEi and CSPulseWidth	[17:12]	0b000000
Read to Write CS pulse width enable	RFBI_CYCLE_TIMEi and RWEnable	[18]	0b0
Read to Read CS pulse width enable	RFBI_CYCLE_TIMEi and RREnable	[19]	0b0
Write to Write CS pulse width enable	RFBI_CYCLE_TIMEi and WWEnable	[20]	0b0
Write to Read CS pulse width enable	RFBI_CYCLE_TIMEi and WREnable	[21]	0b0
From Start Access Time to CLK rising edge used for the first data capture	RFBI_CYCLE_TIMEi and AccessTime	[27:22]	0b000000

(1) i is equal to 0 or 1. For more information, see the DSS chapter in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 6-44. DSS Switching Characteristics—RFBI Mode—Pico DLP[15][17][18]

CsPulseWidth	CS pulse width - RFBI_CYCLE_TIMEi Register	0[19]				ns

(1) A = (WECycleTime – WEOffTime) * (TimeParaGranularity + 1) * L4CLK

(2) B = (WEOffTime – WEOntime) * (TimeParaGranularity + 1) * L4CLK

(3) C = WEOnTime * (TimeParaGranularity + 1) * L4CLK

(4) D = (WECycleTime + CSPulseWidth – WEOffTime) * (TimeParaGranularity + 1) * L4CLK if mode Write to Read or Read to Write is enabled.

(5) E = (WEOnTime – CSOnTime) * (TimeParaGranularity + 1) * L4CLK

(6) F = (CSOffTime – WEOffTime) * (TimeParaGranularity + 1) * L4CLK

(7) G = WECycleTime * (TimeParaGranularity + 1) * L4CLK

(8) H = REOnTime * (TimeParaGranularity + 1) * L4CLK

(9) I = (RECycleTime + CSPulseWidth – REOffTime) * (TimeParaGranularity + 1) * L4CLK if mode Write to Read or Read to Write is enabled.

(10) J = (RECycleTime – REOffTime) * (TimeParaGranularity + 1) * L4CLK

(11) K = (REOffTime – REOntime) * (TimeParaGranularity + 1) * L4CLK

(12) L = (REOnTime – CSOnTime) * (TimeParaGranularity + 1) * L4CLK

(13) M = (CSOffTime – REOffTime) * (TimeParaGranularity + 1) * L4CLK

(14) In rfbi_csx, x is equal to 0 or 1.

(15) See Section 4.3.4, *Processor Clocks*.

(16) 16-bit parallel output interface is selected in DSS register.

(17) At OPP100, L4 clock is 100 MHz and at OPP50, L4 clock is 50 MHz.

(18) rfbi_wr must be at 25 MHz.

(19) These values are calculated by the following formula: RFBI Register (Value) * L4 Clock (ns).

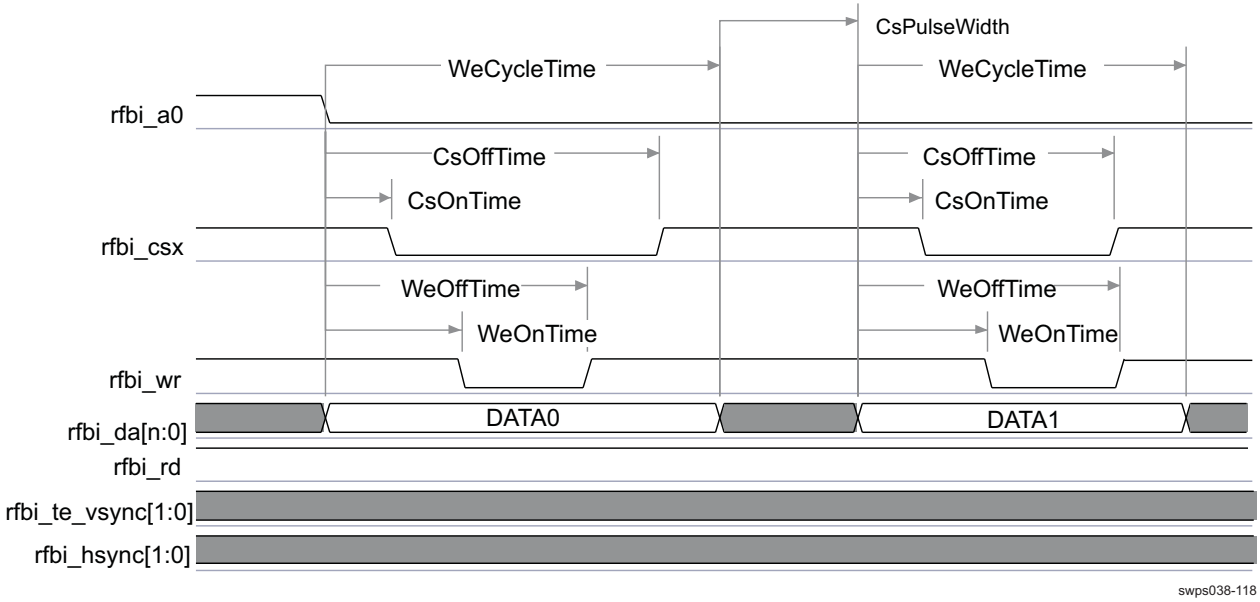

Figure 6-35. DSS—RFBI Mode—Pico DLP—Command / Data Write(1)(2)

(1) In rfbi_csx, x is equal to 0 or 1.

(2) rfbi_da[n:0], n up to 15

6.6 Serial Communications Interfaces

6.6.1 Multichannel Buffered Serial Port (McBSP)

NOTE

For more information, see Multi-Channel Buffered Serial Port chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

The Multichannel Buffered Serial Port (McBSP) provides a full duplex direct serial interface between the chip and other devices in a system such as other application chips, codecs. It can accommodate a wide range of peripherals and clocked frame oriented protocols (I2S, PCM, T) due to its high level of versatility.

McBSP may support two types of data transfer at the system level:

- The full cycle mode, for which one clock period is used to transfer the data, generated on one edge and captured on the same edge (one clock period later).
- The half cycle mode, for which one half clock period is used to transfer the data, generated on one edge and captured on the opposite edge (one half clock period later). Note that a new data is generated only every clock period, which secures the required hold time.

The interface clock (clkx/clkr) activation edge (data/frame sync capture and generation) has to be configured accordingly with the external peripheral (activation edge capability) and the type of data transfer required at the system level.

Depending on the number of pins, McBSP supports either:

- 6-pin mode: dx and dr as data pins; clkx, clkr, fsx, and fsr as control pins
- 4-pin mode: dx and dr as data pins; clkx and fsx pins as control pins. The clkx and fsx pins are internally looped back, via software configuration, respectively to the clkr and fsr internal signals for data receive.

McBSP1 supports the 6-pin mode. McBSP2, 3, 4, and 5 support only the 4-pin mode.

The following sections describe the timing characteristics for applications in normal mode (that is, McBSPx connected to one peripheral) and T applications in multipoint mode.

6.6.1.1 McBSP Timing Conditions—Normal Mode

Table 6-46 through Table 6-70 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-36 through Figure 6-43).

Table 6-45. McBSP Timing Conditions—Normal Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	2	ns
t_F	Input signal fall time	2	ns
Output Condition			
C_{LOAD}	Output load capacitance(1)	10	pF

(1) Buffer strength configuration:
- McBSP4 - Set #1: LB0 = 1.
- Otherwise: LB0 = 0.

Table 6-46. McBSP Output Clock Characteristics—Normal Mode[4]

PARAMETER				OPP100		OPP50		UNIT
				MIN	MAX	MIN	MAX	
McBSP1	tc(CLK)	Cycle time, mcbsp1_clkx (multiplexing mode 0) / mcbsp1_clkr (multiplexing mode 0 & 2)			48		24	MHz
McBSP2	tc(CLK)	Cycle time, mcbsp2_clkx (multiplexing mode 0)			48		24	MHz
McBSP3	tc(CLK)	Cycle time, mcbsp3_clkx	IO set 1 (multiplexing mode 0)		32		16	MHz
			IO set 2 (multiplexing mode 1)		48		24	
			IO set 3 (multiplexing mode 2)		48		24	
McBSP4	tc(CLK)	Cycle time, mcbsp4_clkx	IO set 1 (multiplexing mode 0)		48		16	MHz
			IO set 3 (multiplexing mode 2)		32		16	
McBSP5	tc(CLK)	Cycle time, mcbsp5_clkx	IO set 2 (multiplexing mode 1)		32		16	MHz
$t_{W(CLKH)}$	Typical pulse duration, mcbsp1_clkr / mcbspx_clkx high[2]			0.5*P[1]		0.5*P[1]		ns
$t_{W(CLKL)}$	Typical pulse duration, mcbsp1_clkr / mcbspx_clkx low[2]			0.5*P[1]		0.5*P[1]		ns
$t_{dc(CLK)}$	Duty cycle error, mcbsp1_clkr / mcbspx_clkx[2]			–0.75	0.75	–0.75	0.75	ns
	Jitter, mcbsp1_clkr / mcbspx_clkx[3] / mcbsp_clks			-0.40	0.40	-0.40	0.40	ns

(1) P = mcbspy_clkx[2] or mcbsp1_clkr output clock period in ns

(2) In mcbspy, y is equal to 1, 2, 3, 4, or 5.

(3) In mcbspx, x identifies the McBSP number: 1, 2, 3, 4, or 5.

(4) See Section 4.3.4, *Processor Clocks*.

6.6.1.1.1 Rising Edge as Activation Mode

6.6.1.1.1.1 Timing with Rising Edge as Activation Edge—Receive Mode

Table 6-47. McBSP1, 2, and 3 (Sets #2 and #3) Timing Requirements—Rising Edge and Receive Mode[1] [2]

NO.	PARAMETER			OPP100		OPP50		UNIT
				MIN	MAX	MIN	MAX

6.6.1.2 McBSP in TDM —Multipoint Mode (McBSP3)

For T application in multipoint mode, the processor is considered as a slave. Table 6-72 and Table 6-73 assume testing over the operating conditions and electrical characteristic conditions described below.

Table 6-71. McBSP3 (Set #3) Timing Conditions—T Multipoint Mode[1]

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	1.0	8.5	ns
t_F	Input signal fall time	1.0	8.5	ns
Output Condition				
C_{LOAD}	Output load capacitance[2]		40	pF

(1) For McBSP3, these timings concern only Set #3 (multiplexing mode in McBSP1 pins)

(2) The load setting of the IO buffer: LB0 = 0.

Table 6-72. McBSP3 (Set #3) Timing Requirements—T Multipoint Mode[4]

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	1 / $t_{c(clkxH)}$	Frequency, input clock mcbsp3_clkx		6		6	MHz

Table 6-72. McBSP3 (Set #3) Timing Requirements—T Multipoint Mode[4] (continued)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
	$t_{w(clkxH)}$	Pulse duration, input clock mcbsp3_clkx high	0.5P[1]		0.5P[1]		ns
	$t_{w(clkxL)}$	Pulse duration, input clock mcbsp3_clkx low	0.5P[1]		0.5P[1]		ns
	$t_{dc(clkx)}$	Duty cycle error, input clock mcbsp3_clkx	–8.14	8.14	–8.14	8.14	ns
B3[3]	$t_{su(drV-clkxAE)}$	Setup time, input data mcbsp3_dr valid before input clock mcbsp3_clkx active edge	9		9		ns
B4[3]	$t_{h(clkxAE-drV)}$	Hold time, input data mcbsp3_dr valid after input clock mcbsp3_clkx active edge	2.4		2.4		ns
B5[3]	$t_{su(fsxV-clkxAE)}$	Setup time, input frame synchronization mcbsp3_fsx valid before input clock mcbsp3_clkx active edge	9		9		ns
B6[3]	$t_{h(clkxAE-fsxV)}$	Hold time, input frame synchronization mcbsp3_fsx valid after input clock mcbsp3_clkx active edge	2.4		2.4		ns

(1) P = input clock mcbsp3_clkx period in ns

(2) For McBSP3, these timings concern only Set #3 (multiplexing mode in McBSP1 pins).

(3) See Section 6.6.1.1 for corresponding figures.

(4) See Section 4.3.4, *Processor Clocks*.

Table 6-73. McBSP3 (Set #3) Switching Characteristics—T Multipoint Mode[1]

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
B8[2]	$t_{d(clkxAE-dxV)}$	Delay time, mcbsp3_clkx active edge to output data mcbsp3_dx valid	0.6	15.89	0.6	28.68	ns

(1) For McBSP3, these timings concern only Set #3 (multiplexing mode in McBSP1 pins).

(2) See Section 6.6.1.1 for corresponding figures.

6.6.2 Multichannel Serial Port Interface (McSPI)

NOTE

For more information, see Multichannel SPI chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

McSPI allows a duplex, synchronous, serial communication between a local host and SPI compliant external devices. The following timings are applicable to the different configurations of McSPI in master/slave mode for any McSPI and any channel (n).

6.6.2.1 McSPI—Slave Mode

In slave mode, McSPI initiates data transfer on the data lines (mcspix_somi, mcspix_simo) when it receives an SPI clock (mcspix_clk) from the external SPI master device.

Table 6-75 and Table 6-76 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-44 and Figure 6-45).

Table 6-74. McSPI Timing Conditions—Slave Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	4	ns
t_F	Input signal fall time	4	ns
Output Condition			
C_{LOAD}	Output load capacitance(1)	20	pF

(1) The load setting of the IO buffer: LB0 = 1.

Table 6-75. McSPI Timing Requirements—Slave Mode(1) (3)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SS0	$1/t_{c(CLK)}$	Frequency, mcspix_clk		24		12	MHz
SS1	$t_{w(CLK)}$	Pulse duration, mcspix_clk high or low	0.45*P(2)	0.55*P(2)	0.45*P(2)	0.55*P(2)	ns
SS2	$t_{su(SIMOV-CLKAE)}$	Setup time, mcspix_simo valid before mcspix_clk active edge	4.2		9.5		ns
SS3	$t_{h(SIMOV-CLKAE)}$	Hold time, mcspix_simo valid after mcspix_clk active edge	4.6		9.9		ns
SS4	$t_{su(CS0V-CLKFE)}$	Setup time, mcspix_cs0 valid before mcspix_clk first edge	13.8		28.6		ns
SS5	$t_{h(CS0I-CLKLE)}$	Hold time, mcspix_cs0 invalid after mcspix_clk last edge	13.8		28.6		ns

(1) In mcspix, x is equal to 1, 2, 3, or 4.

(2) P = mcspix_clk clock period

(3) See Section 4.3.4, *Processor Clocks*.

Table 6-76. McSPI Switching Characteristics—Slave Mode(1) (3) (4)

NO.	PARAMETER			OPP100		OPP50		UNIT
				MIN	MAX	MIN	MAX	
SS6	$t_{d(CLKAE-SOMIV)}$	Delay time, mcspix_clk active edge to mcspix_somi shifted		1.8	15.9	3.2	31.7	ns
SS7	$t_{d(CS0AE-SOMIV)}$	Delay time, mcspix_cs0 active edge to mcspix_somi shifted	Modes 0 and 2(2)		15.9		31.7	ns

(1) In mcspix, x is equal to 1, 2, 3, or 4.

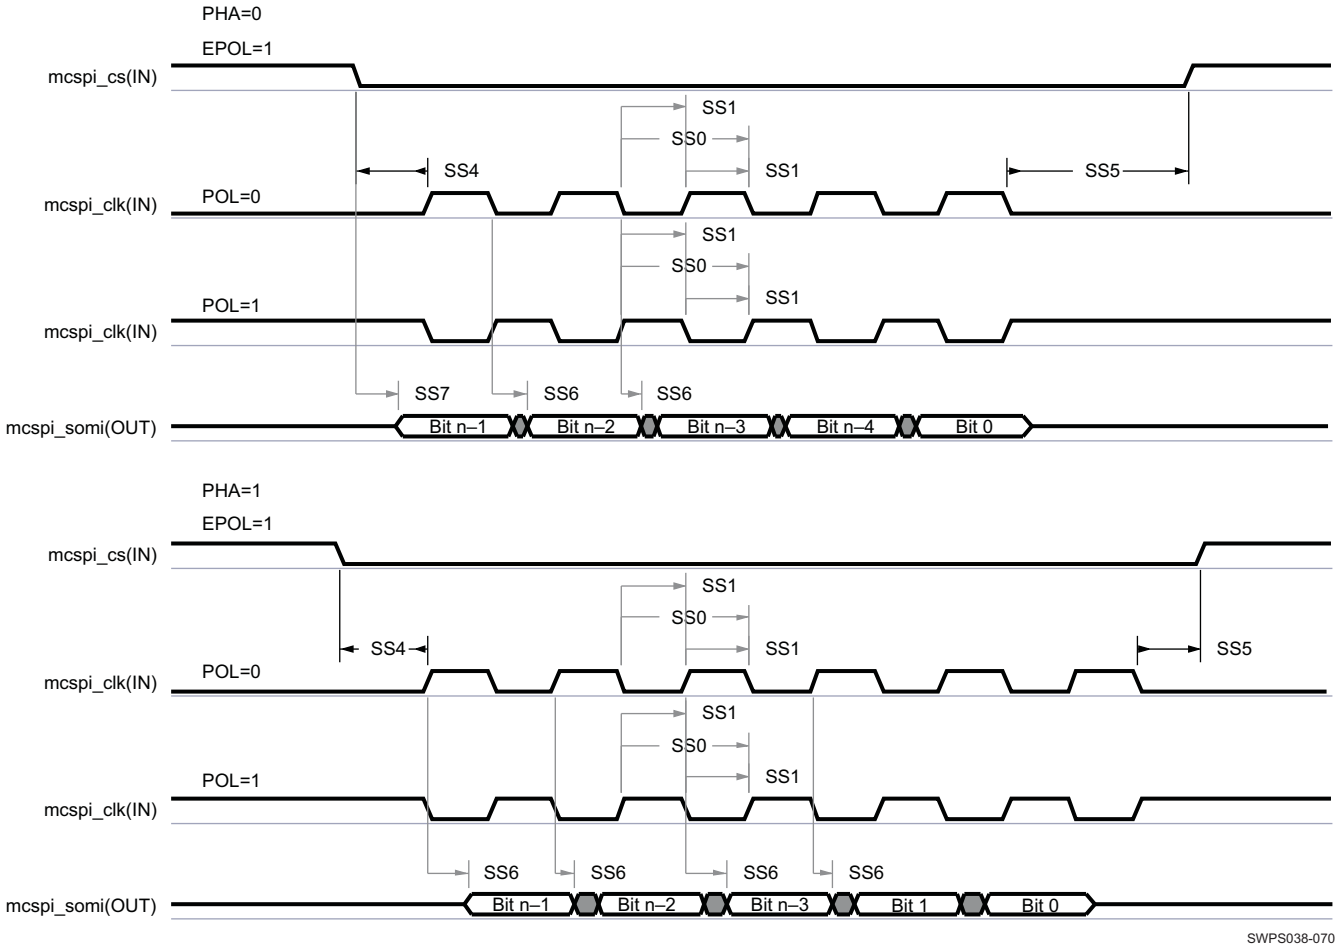
(2) The polarity of mcspix_clk and the active edge (rising or falling) on which mcspix_simo is driven and mcspix_somi is latched is all software configurable:

– mcspix_clk(1) phase programmable with the bit PHA of MCSPI_CH(i)CONF register: PHA = 0 (Modes 0 and 2)

For more information, see the McSPI environment chapter, Data Format Configurations section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4) for modes and phase correspondence description.

(3) This timing applies to all configurations regardless of mcspix_clk polarity and which clock edges are used to drive output data and capture input data.

(4) See Section 4.3.4, *Processor Clocks*.

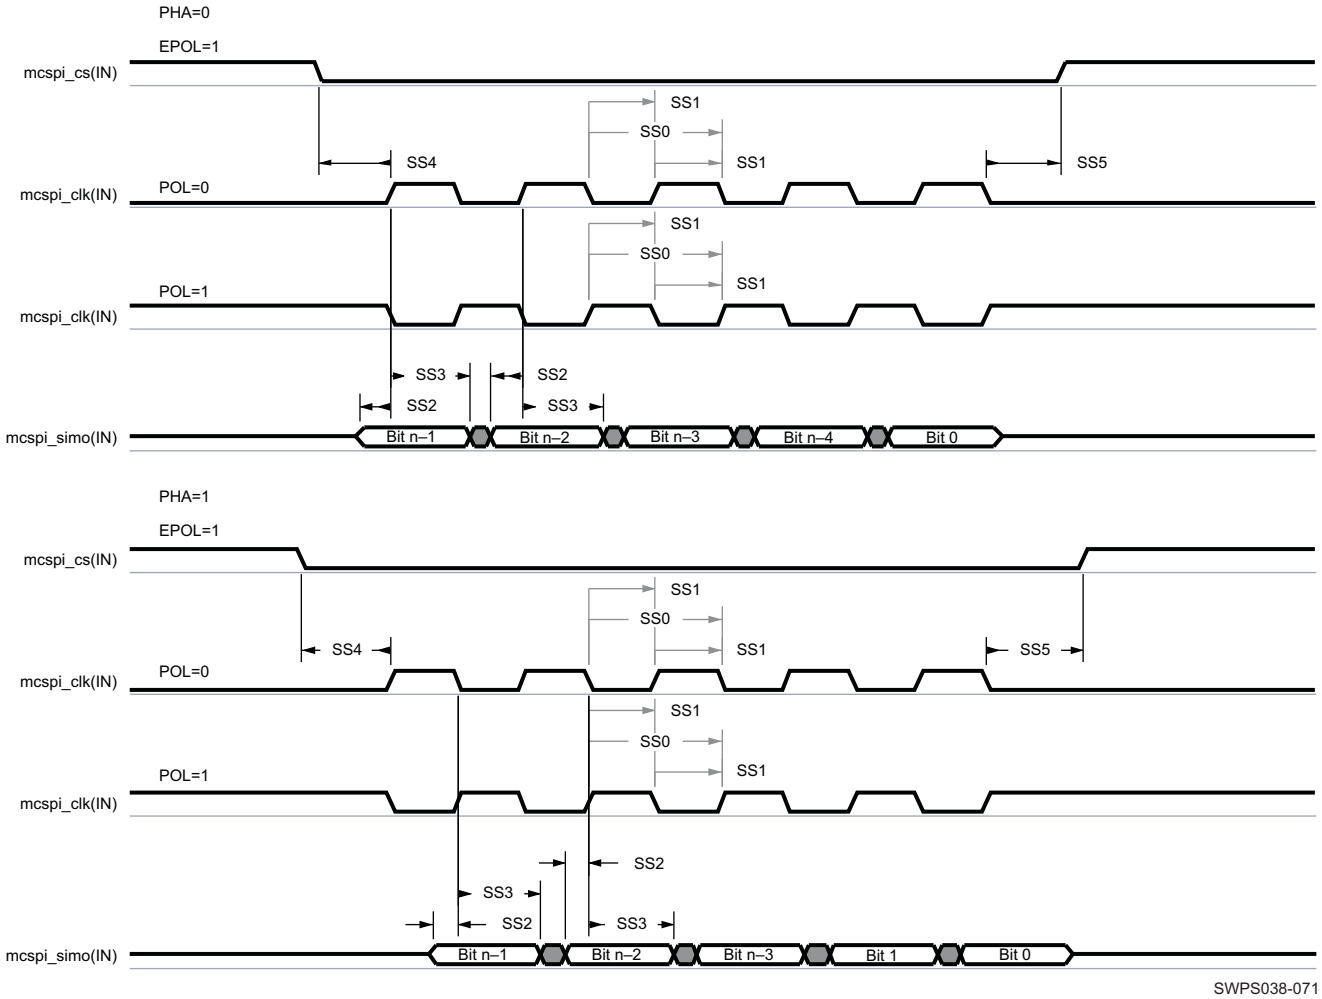


SWPS038-070

(1) The active clock edge selection of mcspi_clk (rising or falling) on which mcspi_simo is driven and mcspi_somi data is latched is software configurable with the bit MCSPI_CH(i)CONF[1] = POL and the bit MCSPI_CH(i)CONF[0] = PHA.

(2) The polarity of mcspi_cs is software configurable with the bit MCSPI_CH(i)CONF[6] = EPOL.

Figure 6-44. McSPI—Slave Mode—Transmit



(1) The active clock edge selection of mcspi_clk (rising or falling) on which mcspi_simo is driven and mcspi_somi data is latched is software configurable with the bit MCSPI_CH(i)CONF[1] = POL and the bit MCSPI_CH(i)CONF[0] = PHA.

(2) The polarity of mcspi_cs is software configuable with the bit MCSPI_CH(i)CONF[6] = EPOL.

Figure 6-45. McSPI—Slave Mode—Receive

6.6.2.2 McSPI—Master Mode

In master mode, McSPI supports multichannel communication. McSPI initiates a data transfer on the data lines (SPIDAT [1:0]) and generates clock (SPICLK) and control signals (SPIEN) to a single SPI slave device at a time.

Table 6-78 and Table 6-81 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-46 and Figure 6-47).

Table 6-77. McSPI Timing Conditions—Master Mode(1)

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	4		ns
t_F	Input signal fall time	4		ns
Output Conditions				
McSPI1, McSPI2, McSPI3, and McSPI4				
C_{LOAD}	Output load capacitance for spix_csn signals		20	pF
McSPI2 and McSPI3				
C_{LOAD}	Output load capacitance for spix_clk and spix_simo		30	pF
McSPI1 and McSPI4				
C_{LOAD}	Output load capacitance for spix_clk and spix_simo		20	pF

(1) Buffer strength configuration: LB0 = 1.

Table 6-78. McSPI1, 2, and 4 Timing Requirements—Master Mode(1) (2)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SM2	$t_{su(SOMIV-CLKAE)}$	Setup time, mcspix_somi valid before mcspix_clk active edge	1.1		1.5		ns
SM3	$t_{h(SOMIV-CLKAE)}$	Hold time, mcspix_somi valid after mcspix_clk active edge	1.9		2.8		ns

(1) In mcspix, x is equal to 1, 2, or 4. In mcspix_csn, n is equal to 0, 1, 2, or 3 for x equal to 1, n is equal to 0 or 1 for x equal to 2 and 4.

(2) See Section 4.3.4, *Processor Clocks*.

Table 6-79. McSPI1, 2, and 4 Switching Characteristics—Master Mode(1) (6)

NO.	PARAMETER			OPP100		OPP50		UNIT
				MIN	MAX	MIN	MAX	
SM0	$1/t_{c(CLK)}$	Frequency, mcspix_clk			48		24	MHz
SM1	$t_{w(CLK)}$	Pulse duration, mcspix_clk high or low		0.45*P(3)	0.55*P(3)	0.45*P(3)	0.55*P(3)	ns
	$t_{R(clk)}$	Rise time, output clock mcspi1_clk and mcspi4_clk			5.72		5.68	ns
		Rise time, output clock mcspi2_clk			7.33		7.31	
	$t_{F(clk)}$	Fall time, output clock mcspi1_clk and mcspi4_clk			5.22		5.21	ns
		Fall time, output clock mcspi2_clk			6.77		6.71	
SM4	$t_{d(CLKAE-SIMOV)}$	Delay time, mcspix_clk active edge to mcspix_simo shifted		–2.1	5.0	–2.1	11.3	ns
SM5	$t_{d(CSnA-CLKFE)}$	Delay time, mcspix_csi active to mcspix_clk first edge	Modes 1 and 3(2)	A(4) – 3.2		A(4) – 4.4		ns
			Modes 0 and 2(2)	B(5) – 3.2		B(5) – 4.4		ns
SM6	$t_{d(CLKLE-CSnI)}$	Delay time, mcspix_clk last edge to mcspix_csi inactive	Modes 1 and 3(2)	B(5) – 3.2		B(5) – 4.4		ns
			Modes 0 and 2(2)	A(4) – 3.2		A(4) – 4.4		ns
SM7	$t_{d(CSnAE-SIMOV)}$	Delay time, mcspix_csi active edge to mcspix_simo shifted			5.0		11.3	ns

(1) In mcspix, x is equal to 1, 2, or 4. In mcspix_csn, n is equal to 0, 1, 2, or 3 for x equal to 1, n is equal to 0 or 1 for x equal to 2 and 4.

(2) The polarity of mcspix_clk and the active edge (rising or falling) on which mcspix_simo is driven and mcspix_somi is latched is all software configurable:
- mcspix_clk(1) phase programmable with the bit PHA of MCSPI_CH(i)CONF register: PHA = 1 (Modes 1 and 3).
- mcspix_clk(1) phase programmable with the bit PHA of MCSPI_CH(i)CONF register: PHA = 0 (Modes 0 and 2).

For more information, see the McSPI environment chapter, Data Format Configurations section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4) for modes and phase correspondence description.

(3) P = mcspix_clk clock period

(4) Case P = 20.8 ns, A = (TCS+0.5)*P(3) (TCS is a bit field of MSPI_CHCONFx[26:25] register).
Case P > 20.8 ns, A = TCS*P(3) (TCS is a bitfield of MSPI_CHCONFx[26:25] register). For more information, see the McSPI chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(5) B = TCS*P(3) (TCS is a bit field of MSPI_CHCONFx[26:25] register). For more information, see the McSPI chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(6) See Section 4.3.4, *Processor Clocks*.

Table 6-80. McSPI3 Timing Requirements—Master Mode(1)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SM2	$t_{su(SOMIV-CLKAE)}$	Setup time, mcspi3_somi valid before mcspi3_clk active edge	1.5		4.3		ns
SM3	$t_{h(SOMIV-CLKAE)}$	Hold time, mcspi3_somi valid after mcspi3_clk active edge	2.8		5.9		ns

(1) See Section 4.3.4, *Processor Clocks*.

Table 6-81. McSPI3 Switching Characteristics—Master Mode(1) (2) (6)

NO.	PARAMETER			OPP100		OPP50		UNIT
				MIN	MAX	MIN	MAX	
SM0	$1/t_{c(CLK)}$	Frequency, mcspi3_clk			24		12	MHz
SM1	$t_{w(CLKH)}$	Pulse duration, mcspi3_clk high or low		0.45*P(3)	0.55*P(3)	0.45*P(3)	0.55*P(3)	ns
	$t_{R(clk)}$	Rise time, output clock mcspi3_clk	CBP Balls: AE2 / AE13		7.33		7.31	ns
			CBP Ball: H26		4.31		4.30	
	$t_{F(clk)}$	Fall time, output clock mcspi3_clk	CBP Balls: AE2 / AE13		6.77		6.71	ns
			CBP Ball: H26		4.0		4.0	
SM4	$t_{d(CLK-SIMO)}$	Delay time, mcspi3_clk active edge to mcspi3_simo shifted		–2.1	11.3	–5.3	23.6	ns
SM5	$t_{d(CSn-CLK)}$	Delay time, mcspi3_csi active to mcspi3_clk first edge	Modes 1 and 3	A(4) – 4.4		A(4) – 10.1		ns
			Modes 0 and 2	B(5) – 4.4		B(5) – 10.1		ns
SM6	$t_{d(CLK-CSn)}$	Delay time, mcspi3_clk last edge to mcspi3_csi inactive	Modes 1 and 3	B(5) – 4.4		B(5) – 10.1		ns
			Modes 0 and 2	A(4) – 4.4		A(4) – 10.1		ns
SM7	$t_{d(csn-simo)}$	Delay time, mcspi3_csi active edge to mcspi3_simo shifted	Modes 0 and 2		11.3		23.6	ns

(1) In mcspi3_csn, n is equal to 0 or 1. The polarity of mcspi3_clk and the active edge (rising or falling) on which mcspi3_simo is driven and mcspi3_somi is latched is all software configurable.
   – mcspi3_clk phase programmable with the bit PHA of MCSPI_CH(i)CONF register: PHA = 1 (Modes 1 and 3).
   – mcspi3_clk phase programmable with the bit PHA of MCSPI_CH(i)CONF register: PHA = 0 (Modes 0 and 2).
   For more information, see the McSPI environment chapter, Data Format Configurations section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4) for modes and phase correspondence description.

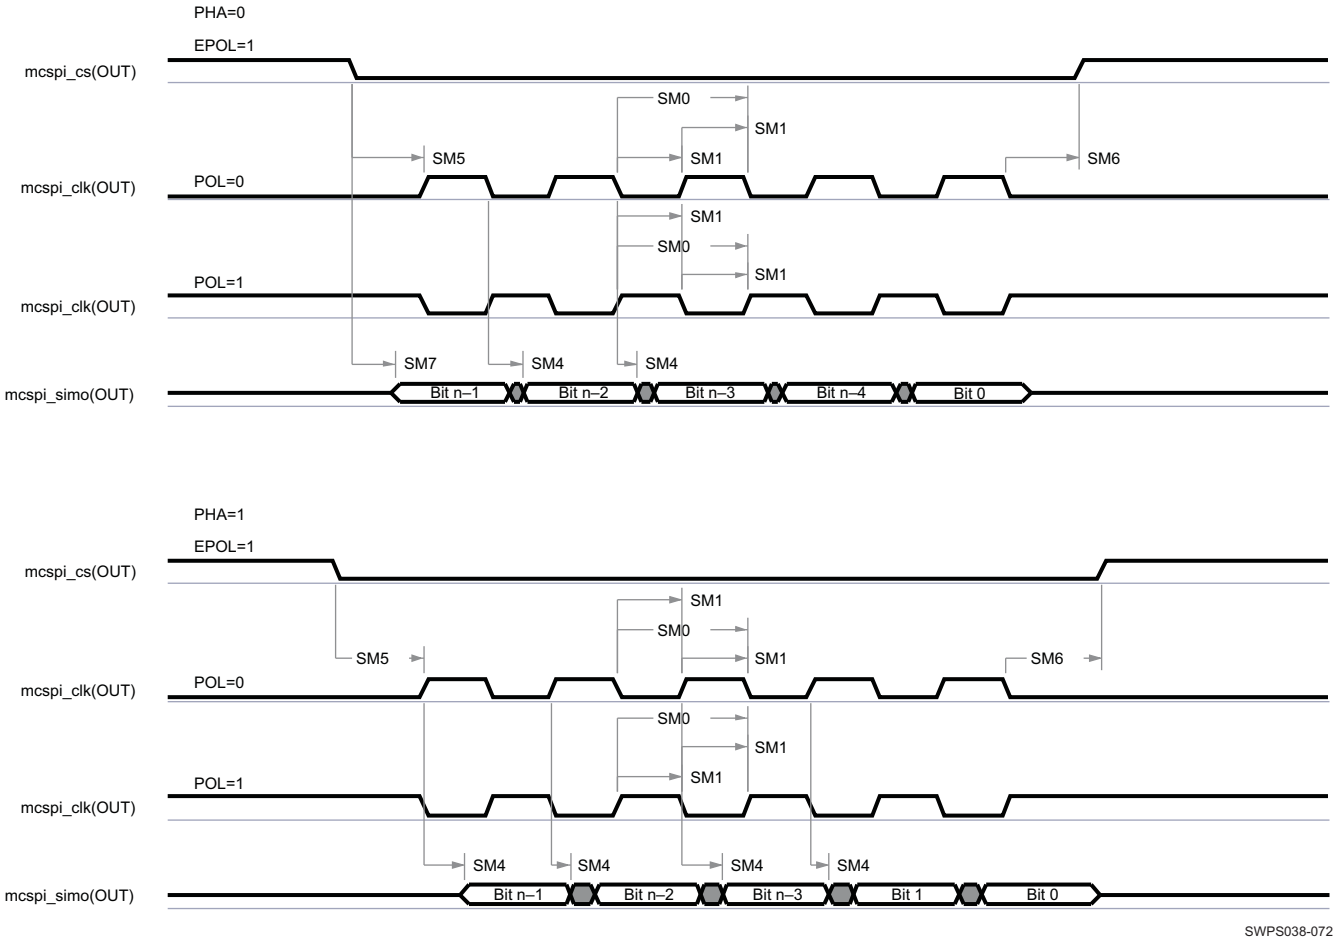
(2) This timing applies to all configurations regardless of McSPI3_CLK polarity and which clock edges are used to drive output data and capture input data.

(3) P = mcspi3_clk clock period

(4) Case P = 20.8 ns, A = (TCS + 0.5)*P(3) (TCS is a bit field of MSPI_CHCONFx[26:25] register).
Case P > 20.8 ns, A = TCS*P(3) (TCS is a bit field of MSPI_CHCONFx[26:25] register). For more information, see the McSPI chapter of *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(5) B = TCS*P(3) (TCS is a bit field of MSPI_CHCONFx[26:25] register). For more information, see the McSPI chapter of *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(6) See Section 4.3.4, *Processor Clocks*.

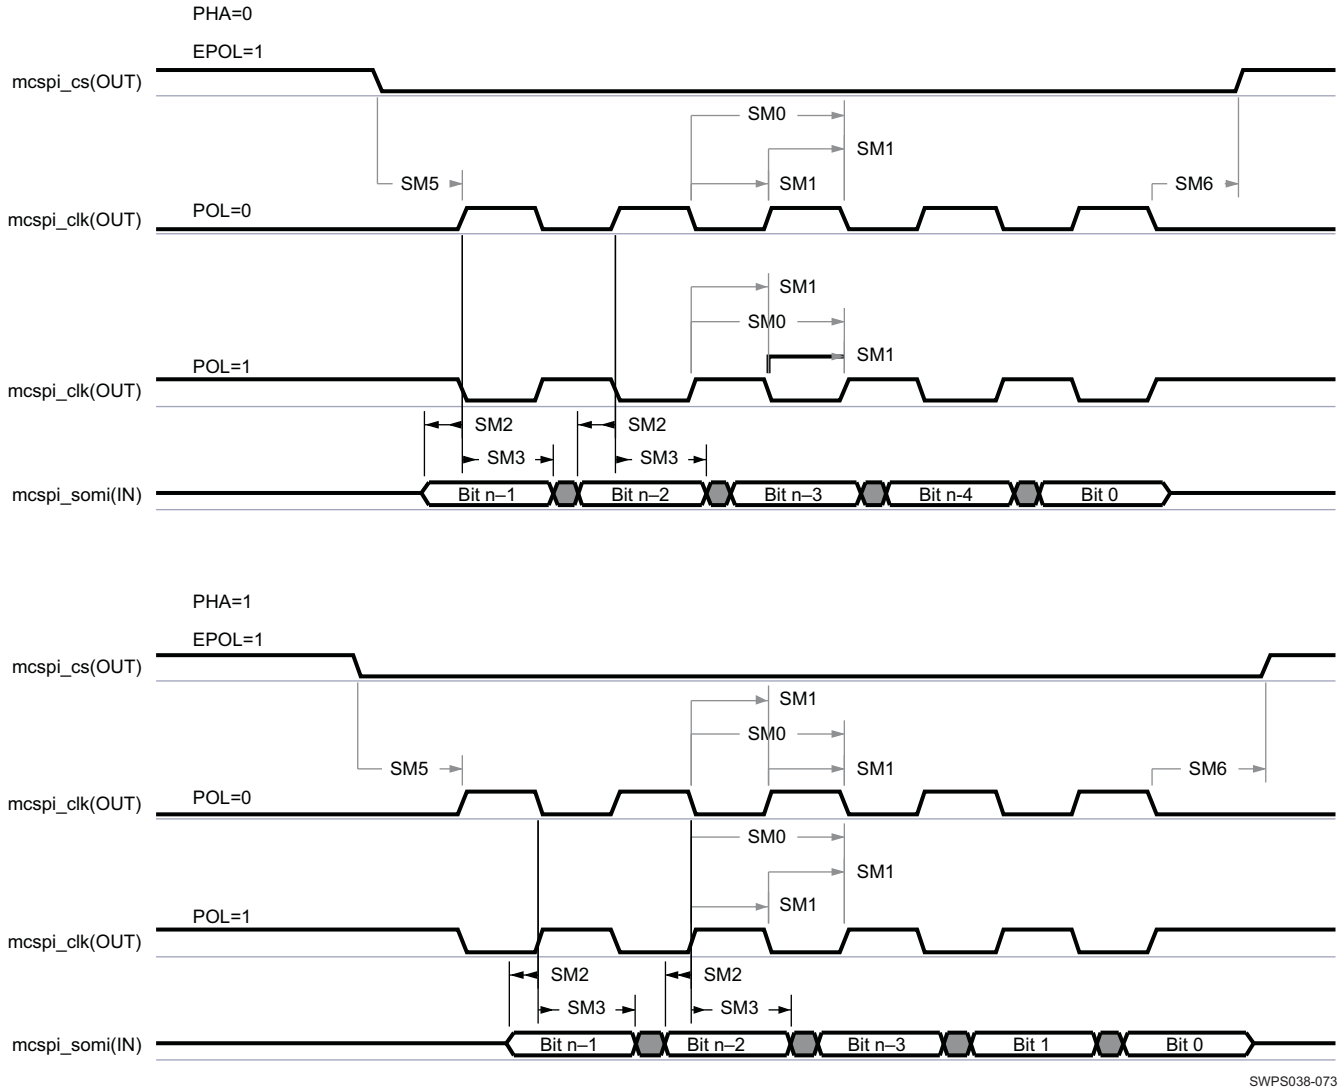


SWPS038-072

(1) The active clock edge selection of mcspi_clk (rising or falling) on which mcspi_simo is driven and mcspi_somi data is latched is software configurable with the bit MCSPI_CH(i)CONF[1] = POL and the bit MCSPI_CH(i)CONF[0] = PHA.

(2) The polarity of mcspi_ncs is software configuable with the bit MCSPI_CH(i)CONF[6] = EPOL.

Figure 6-46. McSPI—Master Mode—Transmit



(1) The active clock edge selection of mcspi_clk (rising or falling) on which mcspi_simo is driven and mcspi_somi data is latched is software configurable with the bit MCSPI_CH(i)CONF[1] = POL and the bit MCSPI_CH(i)CONF[0] = PHA.

(2) The polarity of mcspi_ncs is software configuable with the bit MCSPI_CH(i)CONF[6] = EPOL.

6.6.3 Multiport Full-Speed Universal Serial Bus (FS-USB)

NOTE

For more information, see High-Speed USB Host Subsystem and High-Speed USB OTG Controller / High-Speed USB Host Subsystem section of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

The processor provides three USB ports working in full- and low-speed data transactions (up to 12Mbit/s). When connected to either a serial link controller or a serial PHY (PHY interface modes) it supports:

- 6-pin (Tx: Dat/Se0 or Tx: Dp/) unidirectional mode
- 4-pin bidirectional mode
- 3-pin bidirectional

6.6.3.1 FS-USB—Unidirectional Standard 6-pin Mode

Table 6-83 and Table 6-84 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-48).

Table 6-82. LS- / FS-USB Timing Conditions—Unidirectional Standard 6-Pin Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	2	ns
t_F	Input signal fall time	2	ns
Output Condition			
C_{LOAD}	Output load capacitance(1)	15	pF

(1) Buffer strength configuration: LB0 = 1.

Table 6-83. LS- / FS-USB Timing Requirements—Unidirectional Standard 6-Pin Mode(1) (2)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
FSU1	$t_{d(vp,vm)}$	Time duration, mmx_rxdp and mmx_rx low together during transition		14		14	ns
FSU2	$t_{d(vp,vm)}$	Time duration, mmx_rxdp and mmx_rx high together during transition		8		8	ns
FSU3	$t_{d(rcvU0)}$	Time duration, mmx_rrxcv undefine during a single end 0 (mmx_rxdp and mmx_rx low together)		14		14	ns
FSU4	$t_{d(rcvU1)}$	Time duration, mmx_rxrcv undefine during a single end 1 (mmx_rxdp and mmx_rx high together)		8		8	ns

(1) In mmx, x is equal to 0, 1, or 2.

(2) See Section 4.3.4, *Processor Clocks*.

Table 6-84. LS- / FS-USB Switching Characteristics—Unidirectional Standard 6-Pin Mode(1) (2)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX

6.6.4 Multiport High-Speed Universal Serial Bus (HS-USB)

NOTE

For more information, see High-Speed USB Host Subsystem and High-Speed USB OTG Controller / High-Speed USB OTG Controller and High-Speed USB Host Subsystem and High-Speed USB OTG Controller / High-Speed USB Host Subsystem sections of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

In addition to the full-speed (FS) USB controller, a high-speed (HS) USB OTG controller is incorporated in the device. It allows high-speed transactions (up to 480 Mbit/s) on the USB ports 0, 1, 2, and 3 described below:

- Port 0:
  - 12-bit slave mode (SDR)
- Ports 1 and 2:
  - 12-bit master mode (SDR)
- Port 3:

6.6.4.1 HSUSB0—Port 0—12-bit Slave Mode

Table 6-92 and Table 6-93 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-51).

Table 6-91. HSUSB0 Timing Conditions—12-bit Slave Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	2	ns
t_F	Input signal fall time	2	ns
Output Condition			
C_{LOAD}	Output load capacitance(1)	3.5	pF

(1) Buffer strength configuration: LB0 = 0.

Table 6-92. HSUSB0 Timing Requirements—12-bit Slave Mode(3) (4)

NO.	PARAMETER		OPP100		UNIT
			MIN	MAX	
HSU0	$f_{p(CLK)}$	hsusb0_clk clock frequency(1)		60.03	MHz
	$t_{J(CLK)}$	Cycle jitter(2), hsusb0_clk		500	ps
HSU3	$t_{s(DIRV-CLKH)}$	Setup time, hsusb0_dir valid before hsusb0_clk rising edge	6.68		ns
	$t_{s(NXTV-CLKH)}$	Setup time, hsusb0_nxt valid before hsusb0_clk rising edge	6.68		ns
HSU4	$t_{h(CLKH-DIRIV)}$	Hold time, hsusb0_dir valid after hsusb0_clk rising edge	0		ns
	$t_{h(CLKH-NXT/IV)}$	Hold time, hsusb0_nxt valid after hsusb0_clk rising edge	0		ns
HSU5	$t_{s(DATAV-CLKH)}$	Setup time, hsusb0_data[0:7] valid before hsusb0_clk rising edge	6.68		ns
HSU6	$t_{h(CLKH-DATIV)}$	Hold time, hsusb0_data[0:7] valid after hsusb0_clk rising edge	0		ns

(1) Related with the input maximum frequency supported by the USB module.

(2) Maximum cycle jitter supported by hsusb0_clk input clock

(3) The timing requirements are assured up to the cycle jitter error condition specified.

(4) See Section 4.3.4, *Processor Clocks*.

Table 6-93. HSUSB0 Switching Characteristics—12-bit Slave Mode(1)

NO.	PARAMETER		OPP100		UNIT
			MIN	MAX	
HSU1	$t_{d(clkL-STPV)}$	Delay time, hsusb0_clk high to output usb0_stp valid		8.6	ns
	$t_{d(clkL-STPIV)}$	Delay time, hsusb0_clk high to output usb0_stp invalid	0		ns
HSU2	$t_{d(clkL-DV)}$	Delay time, hsusb0_clk high to output hsusb0_data[0:7] valid		8.6	ns
	$t_{d(clkL-DIV)}$	Delay time, hsusb0_clk high to output hsusb0_data[0:7] invalid	0		ns

(1) See Section 4.3.4, *Processor Clocks*.

NO.	PARAMETER		OPP100		UNIT
			MIN	MAX	
HSU6	$t_{h(clkH-dV)}$	Hold time, input data hsusbx_data[7:0] valid after output clock hsusbx_clk rising edge	–0.52		ns

(1) In hsusbx, x is equal to 1 or 2.

(2) See Section 4.3.4, *Processor Clocks*.

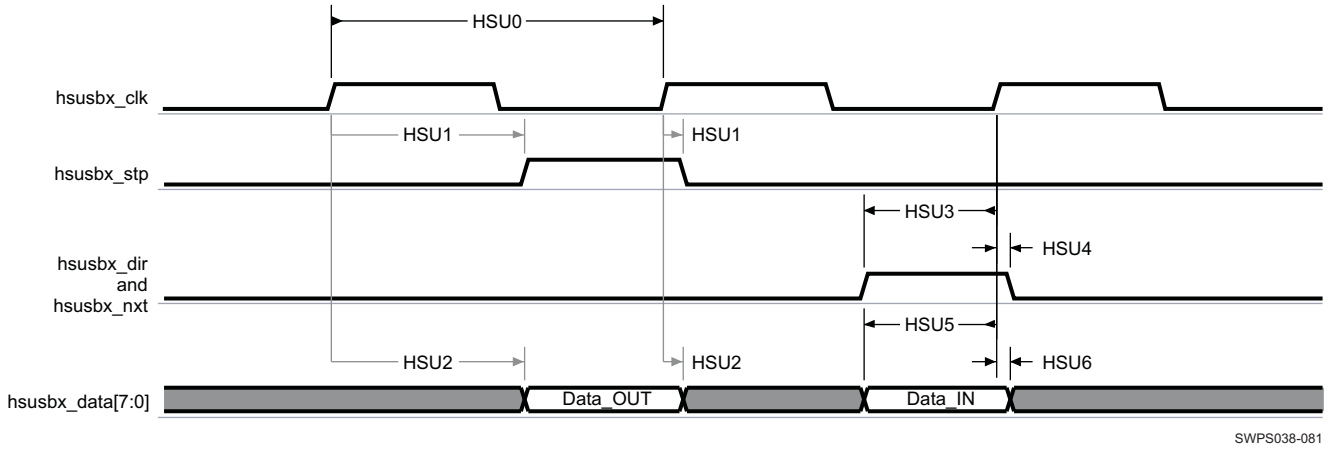
Table 6-96. HSUSB1 and HSUSB2 Switching Characteristics—12-bit Master Mode(1) (3)

NO.	PARAMETER		OPP100		UNIT
			MIN	MAX	
HSU0	$f_{p(clk)}$	Frequency, output clock hsusbx_clk		60	MHz
	$t_{J(clk)}$	Jitter standard deviation(2), output clock hsusbx_clk		400	ps
HSU1	$t_{d(clkH-stpV)}$	Delay time, output clock hsusbx_clk rising edge to output stop signal hsusbx_stp valid		12.81	ns
	$t_{d(clkH-stplV)}$	Delay time, output clock hsusbx_clk rising edge to output stop signal hsusbx_stp invalid	1.95		ns
HSU2	$t_{d(clkH-dV)}$	Delay time, output clock hsusbx_clk rising edge to output data hsusbx_data[7:0] valid		12.81	ns
	$t_{d(clkH-dIV)}$	Delay time, output clock hsusbx_clk rising edge to output data hsusbx_data[7:0] invalid	1.95		ns
	$t_{R(d)}$	Rise time, output data hsusbx_data[7:0]		0	ns
	$t_{F(d)}$	Fall time, output data hsusbx_data[7:0]		0	ns

(1) In hsusbx, x is equal to 1 or 2.

(2) The jitter probability density can be approximated by a Gaussian function.

(3) See Section 4.3.4, *Processor Clocks*.



(1) In hsusbx, x is equal to 1 or 2.

Figure 6-52. HSUSB1 and HSUSB2—12-bit Master Mode

6.6.5 Inter-Integrated Circuit Interface (I^2C)

NOTE

For more information, see Multimaster High-Speed I2C Controller chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

The multi-master I^2C peripheral provides an interface between two or more devices via an I^2C serial bus.

The I^2C controller supports the multi-master mode which allows more than one device capable of controlling the bus to be connected to it. Each I^2C device is recognized by a unique address and can operates as either transmitter or receiver, according to the function of the device. In addition to being a transmitter or receiver, a device connected to the I^2C bus can also be considered as master or slave when performing data transfers. This data transfer is carried out via two serial bidirectional wires:

- An SDA data line
- An SCL clock line

In Figure 6-53 the data transfer is in master or slave configuration with 7-bit addressing format.

The I^2C interface is compliant with Philips I^2C specification version 2.1. It supports standard mode (up to 100K bits/s), fast mode (up to 400K bits/s) and high-speed mode (up to 3.4Mb/s).

6.6.5.1 I^2C—Standard and Fast Modes

Table 6-97. I^2C—Standard and Fast Modes

NO.	PARAMETER		STANDARD MODE		FAST MODE		UNIT
			MIN	MAX	MIN	MAX	
	f_{scl}	Frequency, clock i2cx_scl(4)		100		400	kHz
I1	$t_{w(sclH)}$	Pulse duration, clock i2cx_scl(4) high	4.0		0.6		µs
I2	$t_{w(sclL)}$	Pulse duration, clock i2cx_scl(4) low	4.7		1.3		µs
I3	$t_{su(sdaV-sclH)}$	Setup time, data i2cx_sda(4) valid before clock i2cx_scl(4) active level	250		100(1)		ns
I4	$t_{h(sclH-sdaV)}$	Hold time, data i2cx_sda(4) valid after clock i2cx_scl(4) active level	0(2)	3.45(3)	0(2)	0.9(3)	µs
I5	$t_{su(sdaL-sclH)}$	Setup time, clock i2cx_scl(4) high after data i2cx_sda(4) low (for a START(5) condition or a repeated START condition)	4.7		0.6		µs
I6	$t_{h(sclH-sdaH)}$	Hold time, data i2cx_sda low level after clock i2cx_scl(4) high level (STOP condition)	4.0		0.6		µs
I7	$t_{h(sclH-RSTART)}$	Hold time, data i2cx_sda(4) low level after clock i2cx_scl(4) high level (for a repeated START condition)	4.0		0.6		µs
I8	$t_{w(sdaH)}$	Pulse duration, data i2cx_sda(4) high between STOP and START conditions	4.7(4)		1.3		µs
	$t_{R(scl)}$	Rise time, clock i2cx_scl(4)		1000	20 + 0.1C_B	300	ns
	$t_{F(scl)}$	Fall time, clock i2cx_scl(4)		300	20 + 0.1C_B	300	ns
	$t_{R(sda)}$	Rise time, data i2cx_sda(4)		1000	20 + 0.1C_B	300	ns
	$t_{F(sda)}$	Fall time, data i2cx_sda(4)		300	20 + 0.1C_B	300	ns
	C_B	Capacitive load for each bus line		400		400	pF

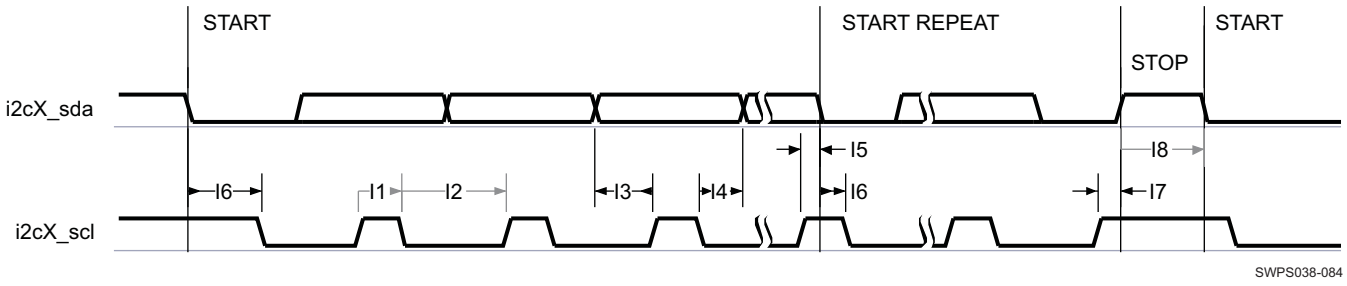
(1) A fast-mode I^2C-bus device can be used in a standard-mode I^2C-bus system, but the requirement $t_{su(SDAV-SCLH)} \geq 250$ ns must then be met. This is automatically the case if the device does not stretch the low period of the i2cx_scl(4). If such a device does stretch the low period of the i2cx_scl(4), it must output the next data bit to the i2cx_sda(4) line $t_{r(SDA)}$ max + $t_{su(SDAV-SCLH)}$ = 1000 + 250 = 1250 ns (according to the standard-mode I^2C-bus specification) before the i2cx_scl(4) line is released.

(2) The device provides (via the I^2C bus) a minimum hold time (= I2C_FCLK period x (PSC+1) x 4) for the i2cx_sda(4) signal (see the fall and rise times of i2cx_scl(4)) to bridge the undefined region of the falling edge of i2cx_scl(4).

(3) The maximum $t_{h(SCLH-SDA)}$ has only to be met if the device does not stretch the low period of the i2cx_scl(4) signal.

(4) In i2cx, x is equal to 1, 2, 3, or 4. Note that I2C4 is master transmitter only.

(5) After this time, the first clock is generated.



(1) In i2cX, X is equal to 1, 2, 3, or 4.

Figure 6-53. I²C—Standard and Fast Modes

6.6.5.2 I²C—High-Speed Mode

Table 6-98. I²C—High-Speed Mode

NO.	PARAMETER		MIN	MAX	UNIT
	f_{scl}	Frequency, clock i2cx_scl(3)		3.4(5)	MHz
I1	$t_{w(sclH)}$	Pulse duration, clock i2cx_scl(3) high	60(1)		ns
I2	$t_{w(sclL)}$	Pulse duration, clock i2cx_scl(3) low	160(1)		ns
I3	$t_{su(sdaV-sclH)}$	Setup time, data i2cx_sda(3) valid before clock i2cx_scl(3) active level	10		ns
I4	$t_{h(sclH-sdaV)}$	Hold time, data i2cx_sda(3) valid after clock i2cx_scl(3) active level	0(4)	70	ns
I5	$t_{su(sdaL-sclH)}$	Setup time, clock i2cx_scl(3) high after data i2cx_sda(3) low (for a START(2) condition or a repeated START condition)	160		ns
I6	$t_{h(sclH-sdaH)}$	Hold time, data i2cx_sda(3) low level after clock i2cx_scl(3) high level (STOP condition)	160		ns
I7	$t_{h(sclH-RSTART)}$	Hold time, data i2cx_sda(3) low level after clock i2cx_scl(3) high level (for a repeated START condition)	160		ns
	$t_{R(scl)}$	Rise time, clock i2cx_scl(3)	10	40	ns
	$t_{R(scl)}$	Rise time, clock i2cx_scl(3) after a repeated START condition and after a bit acknowledge	10	80	ns
	$t_{F(scl)}$	Fall time, clock i2cx_scl(3)	10	40	ns
	$t_{R(sda)}$	Rise time, data i2cx_sda(3)	10	80	ns
	$t_{F(sda)}$	Fall time, data i2cx_sda(3)	10	80	ns
	C_B	Capacitive load for each bus line		100	pF

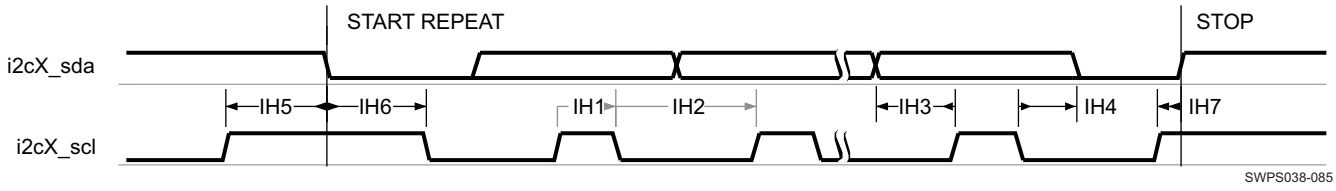
(1) HS-mode master devices generate a serial clock signal with a high to low ratio of 1 to 2. $t_{w(sclL)} > 2 * t_{w(sclH)}$.

(2) After this time, the first clock is generated.

(3) In i2cx, x is equal to 1, 2, 3, or 4. Note that I2C4 is master transmitter only.

(4) The device provides (via the I²C bus) a minimum hold time (= I2C_FCLK period x 4) for the i2cx_sda(3) signal (see the fall and rise times of i2cx_scl(3)) to bridge the undefined region of the falling edge of i2cx_scl(3).

(5) The I2C4 clock frequency in high-speed mode is equal to the sys_xtalin input clock frequency divided by 15.



(1) In i2cX, X is equal to 1, 2, 3, or 4.

Figure 6-54. I²C—High-Speed Mode

6.6.6 HDQ / 1-Wire Interface (HDQ/1-Wire)

NOTE

For more information, see HDQ/1-Wire / HDQ/1-Wire chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

The module is intended to work with both HDQ and 1-Wire protocols. The protocols use a single wire to communicate between the master and the slave. The protocols employ an asynchronous return to one mechanism where, after any command, the line is pulled high.

6.6.6.1 HDQ/1-Wire—HDQ Mode

Table 6-100 and Table 6-102 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-55 through Figure 6-59).

Table 6-100. HDQ Interface Read Timing

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
t_{CYCH}	Read bit window timing	190		250	µs
t_{HW1}	Read one data valid after HDQ low	32(2)		66(2)	µs
t_{HW0}	Read zero data hold after HDQ low	70(2)		145(2)	µs
t_{RSPS}	Response time from HDQ slave device(1)	190		320	µs

(1) Defined by software

(2) If the HDQ slave device drives a logic-low state after t_{HW0} max, it can be interpreted as a break pulse. For more information see Table 6-101 and the HDQ/1-Wire chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

Table 6-101. HDQ Sampling Cases(1)

CASES	FIRST SAMPLING (at 68 µs)	SECOND SAMPLING (at 180 µs)
1	L (logic-low state)	L (logic-low state)
2	L (logic-low state)	H (logic-high state)
3	H (logic-high state)	L (logic-low state)
4	H (logic-high state)	H (logic-high state)

(1) The different cases can be interpreted as follows:

- Case 1: If a logic-low state is present at the first sampling time and also at the second sampling time, the receive data can be interpreted as a break pulse.
- Case 2: If a logic-low state is present at the first sampling time and a logic-high state is present at the second sampling time, the receive data on the line is a zero (data).
- Case 3: Undefined.
- Case 4: If a logic-high state is present at the first sampling time and also at the second sampling time, the receive data on the line is a one (data).

Table 6-102. HDQ Write Switching Characteristics

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
t_B	Break timing	190			µs
t_{BR}	Break recovery time	40			µs
t_{CYCD}	Write bit windows timing	190			µs
t_{DW1}	Write one data valid after HDQ low	0.5		50	µs
t_{DW0}	Write zero data hold after HDQ low	86		145	µs

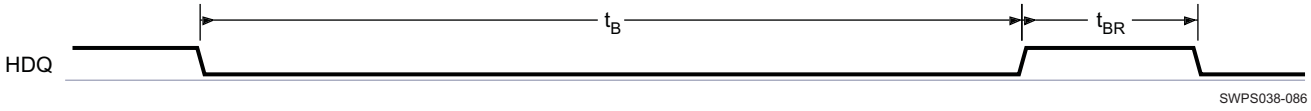

Figure 6-55. HDQ Break and Break Recovery Timing— HDQ Interface Writing to Slave

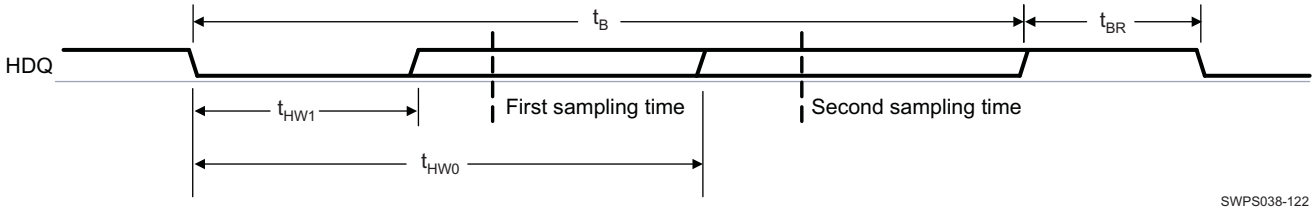

Figure 6-56. HDQ Break Detection— HDQ Interface Reading Slave

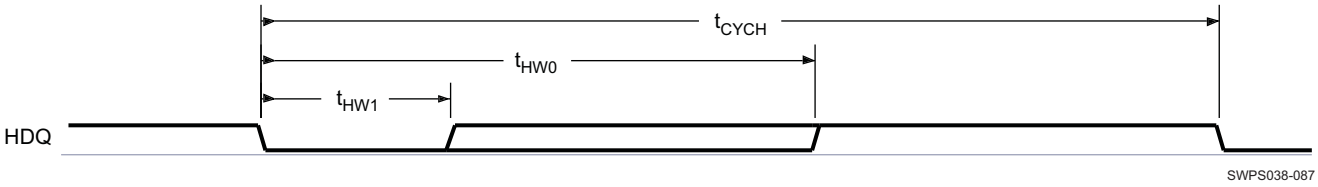

Figure 6-57. HDQ Interface Bit Read Timing (Data)

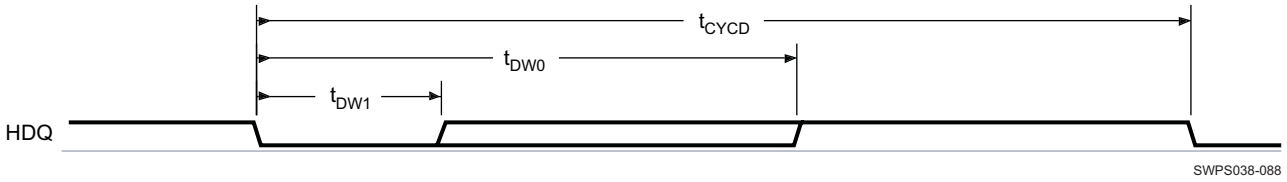

Figure 6-58. HDQ Interface Bit Write Timing (Command/Address or Data)

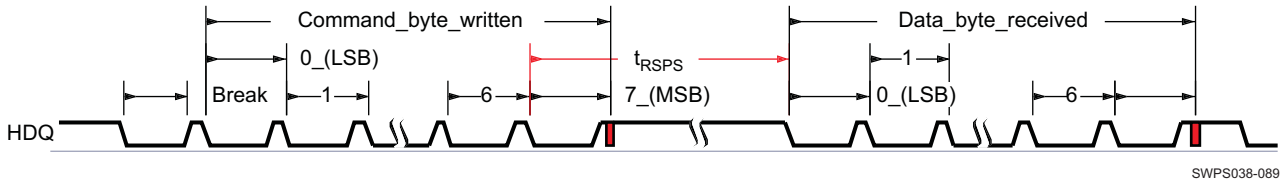

Figure 6-59. HDQ—Communication

6.6.6.2 HDQ/1-Wire—1-Wire Mode

Table 6-103 and Table 6-104 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-60 through Figure 6-63).

Table 6-103. HDQ/1-Wire Timing Requirements—1-Wire Mode

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
t_{PDH}	Presence pulse delay high	15		60	µs
t_{PDL}	Presence pulse delay low	60		240	µs
t_{RDV}	Read data valid time	t_{LOWR}		15	µs
t_{REL}	Read data release time	0		45	µs

Table 6-104. HDQ/1-Wire Switching Characteristics—1-Wire Mode

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
t_{RSTL}	Reset time low	480		960	µs
t_{RSTH}	Reset time high	480			µs
t_{SLOT}	Bit cycle time	60		120	µs
t_{LOW1}	Write bit-one time	1		15	µs
t_{LOW0}	Write bit-zero time(2)	60		120	µs
t_{REC}	Recovery time	1			µs
t_{LOWR}	Read bit strobe time(1)	1		15	µs

(1) t_{LOWR} (low pulse sent by the master) must be short as possible to maximize the master sampling window.

(2) t_{LOW0} must be less than t_{SLOT}.

UART3 (uart3_tx_irtx): G26	2	t_R, Rise time		0.6	2.4	ns
		t_F, Fall time				
		C_L, Output load		2	22	pF

Table 6-105. UART Switching Characteristics[2] (continued)

SIGNAL NAME	MUX MODE	DESCRIPTION	MIN	MAX	UNIT
UART3 (uart3_tx_irtx): T27	2	t_R, Rise time	1.5	5.5	ns
		t_F, Fall time			
		C_L, Output load	2	22	pF
Universal Asynchronous Receiver/Transmitter (UART4)					
UART4 (uart4_tx): K8	2	t_R, Rise time	0.6	2.4	ns
		t_F, Fall time			
		C_L, Output load	2	22	pF

(1) The mode is configured by bits SC0 and SC1 of the IO cell. For more details, see the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(2) Caution: Up to a rise time or a fall time of 1.2 ns, this can create EMI parasitics.

6.6.7.2 UART3 IrDA

The IrDA module can operate in three different modes:

- Slow infrared (SIR) (≤ 115.2 Kbits/s)
- Medium infrared (MIR) (0.576 Mbits/s and 1.152 Mbits/s)
- Fast infrared (FIR) (4 Mbits/s)

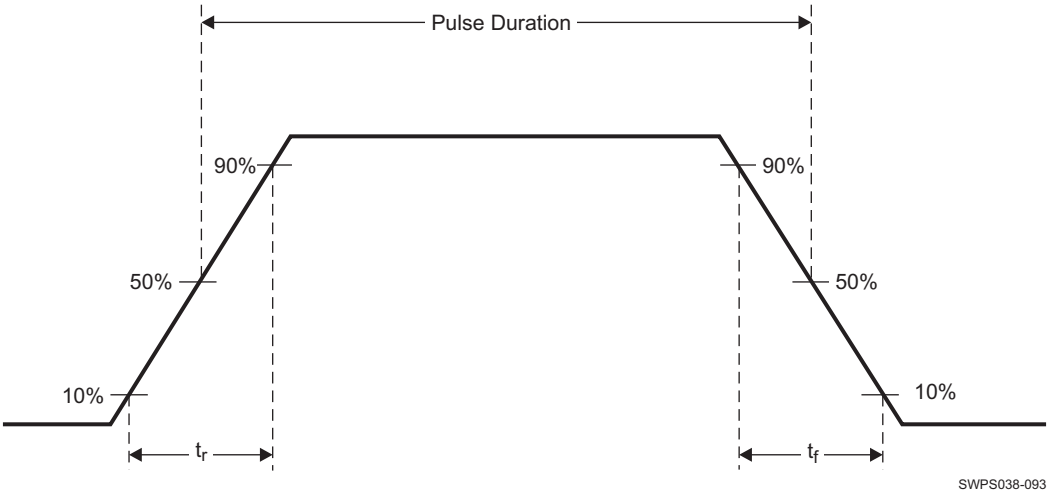

Figure 6-64. UART IrDA Pulse Parameters

6.6.7.2.1 UART3 IrDA—Receive Mode

6.6.8 Removable Media Interfaces

6.6.8.1 Multimedia Memory Card and Secure Digital IO Card (MMC)

NOTE

For more information, see MMC/SD/SDIO Card Interface chapter of the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

The MMC host controller provides an interface to high-speed and standard MMC, SD memory cards, or SDIO cards. The application interface is responsible for managing transaction semantics. The MMC/SDIO host controller deals with MMC/SDIO protocol at transmission level, packing data, adding CRC, start/end bit, and checking for syntactical correctness.

There are three MMC interfaces on the device:

- MMC1:
  - 1.8-V / 3-V support
  - 4-bit in Standard MMC, High-Speed MMC, Standard SD, and High-Speed SD modes

- MMC2:
  - 1.8-V support
  - 8-bit without external transceiver
  - 4-bit with external transceiver allowing supporting 3-V peripherals. Transceiver direction control signals are multiplexed with the upper four data bits.
- MMC3:
  - 1.8-V support
  - 8-bit without external transceiver

6.6.8.1.1 MMC1 Interface—SD Identification Modes

Table 6-110 and Table 6-111 assume testing over the recommended operating conditions and electrical characteristic conditions below.

Table 6-109. MMC1 Interface Timing Conditions—SD Identification Modes

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	10	ns
t_F	Input signal fall time	10	ns
Output Condition			
C_{LOAD}	Output load capacitance(1)	40	pF

(1) Buffer strength configuration: LB0 = 0.

Table 6-110. MMC1 Interface Timing Requirements—SD Identification Modes(1) (2)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
MMC1 Interface (1.8-V IO)							
SD3	$t_{su(CMDV-CLKIH)}$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge	1198.4		1198.4		ns
SD4	$t_{h(CLKIH-CMDIV)}$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge	1249.2		1249.2		ns
MMC1 Interface (3.0-V IO)							
SD3	$t_{su(CMDV-CLKIH)}$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge	1198.4		1198.4		ns
SD4	$t_{h(CLKIH-CMDIV)}$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge	1249.2		1249.2		ns

(1) Corresponding figures showing timing parameters are common with other interface modes. (See SD , HS SD modes).

(2) See Section 4.3.4, *Processor Clocks*.

Table 6-111. MMC1 Interface Switching Characteristics—SD Identification Modes(4) (7)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SD Identification Mode							
SD1	$t_{c(clk)}$	Frequency(1), output clock period		0.4		0.4	MHz

	$t_{F(data)}$	Fall time, output data		10		10	ns
SD5	$t_{d(CLKOH-CMD)}$	Delay time, mmc1_clk rising clock edge to mmc1_cmd transition	6.3	2492.7	6.3	2492.7	ns
MMC1 Interface (3.0-V IO)							
	$t_{R(clk)}$	Rise time, output clock		10		10	ns
	$t_{F(clk)}$	Fall time, output clock		10		10	ns
	$t_{R(data)}$	Rise time, output data		10		10	ns
	$t_{F(data)}$	Fall time, output data		10		10	ns
SD5	$t_{d(CLKOH-CMD)}$	Delay time, mmc1_clk rising clock edge to mmc1_cmd transition	6.3	2492.7	6.3	2492.7	ns

(1) Related with the output clock maximum and minimum frequencies programmable in mmc module.

(2) PO = output clock period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) Corresponding figures showing timing parameters are common with other interface modes. (See SD, HS SD modes).

(5) The X parameter is defined as follows:

CLKD	X
1 or Even	0.5
Odd	(trunk[CLKD/2]+1)/CLKD

All required details about clock division factor CLKD can be found in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(6) The Y parameter is defined as follows:

CLKD	Y
1 or Even	0.5
Odd	(trunk[CLKD/2])/CLKD

All required details about clock division factor CLKD can be found in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(7) See Section 4.3.4, *Processor Clocks*.

6.6.8.1.2 MMC1 Interface—High-Speed SD Mode

Table 6-113 and Table 6-114 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-65 and Figure 6-66).

Table 6-112. MMC1 Interface Timing Conditions—High-Speed SD Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	3	ns
t_F	Input signal fall time	3	ns
Output Condition			
C_{LOAD}	Output load capacitance(1)	40	pF

(1) Buffer strength configuration: SPEEDCTRL = 1.

Table 6-113. MMC1 Interface Timing Requirements—High-Speed SD Mode[2]

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
MMC1 Interface (1.8-V IO)							
HSSD3	$t_{su(CMDV-CLKIH)}$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge	5.6		26		ns
HSSD4	$t_{h(CLKIH-CMDIV)}$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge	2.3		1.9		ns
HSSD7	$t_{su(DATxV-CLKIH)}$	Setup time, mmc1_dat[n:0][1] valid before mmc1_clk rising clock edge	5.6		26		ns
HSSD8	$t_{h(CLKIH-DATxIV)}$	Hold time, mmc1_dat[n:0][1] valid after mmc1_clk rising clock edge	2.3		1.9		ns
MMC1 Interface (3.0-V IO)							
HSSD3	$t_{su(CMDV-CLKIH)}$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge	5.6		26		ns
HSSD4	$t_{h(CLKIH-CMDIV)}$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge	2.3		1.9		ns
HSSD7	$t_{su(DATxV-CLKIH)}$	Setup time, mmc1_dat[n:0][1] valid before mmc1_clk rising clock edge	5.6		26		ns
HSSD8	$t_{h(CLKIH-DATxIV)}$	Hold time, mmc1_dat[n:0][1] valid after mmc1_clk rising clock edge	2.3		1.9		ns

(1) In mmc1_dat[n:0], n is equal to 3.

(2) See Section 4.3.4, *Processor Clocks*.

Table 6-114. MMC1 Interface Switching Characteristics—High-Speed SD Mode(7)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
High-Speed SD Mode							
HSSD1	$t_{c(clk)}$	Frequency(1), output clock period		48		24	MHz
HSSD2	$t_{W(clkH)}$	Typical pulse duration, output clock high	X(4)*PO(2)		X(4)*PO(2)		ns
HSSD2	$t_{W(clkL)}$	Typical pulse duration, output clock low	Y(5)*PO(2)		Y(5)*PO(2)		ns
	$t_{dc(clk)}$	Duty cycle error, output clock		1041.67		2083.33	ps
	$t_{J(clk)}$	Jitter standard deviation(3), output clock		200		200	ps
MMC1 Interface (1.8-V IO)							
	$t_{R(clk)}$	Rise time, output clock		3		3	ns
	$t_{F(clk)}$	Fall time, output clock		3		3	ns
	$t_{R(data)}$	Rise time, output data		3		3	ns
	$t_{F(data)}$	Fall time, output data		3		3	ns
HSSD5	$t_{d(CLKOH-CMD)}$	Delay time, mmc1_clk rising clock edge to mmc1_cmd transition	3.72	14.11	4.13	34.53	ns
HSSD6	$t_{d(CLKOH-DATx)}$	Delay time, mmc1_clk rising clock edge to mmc1_dat[n:0](6) transition	3.72	14.11	4.13	34.53	ns
MMC1 Interface (3.0-V IO)							
	$t_{R(clk)}$	Rise time, output clock		3		3	ns
	$t_{F(clk)}$	Fall time, output clock		3		3	ns
	$t_{R(data)}$	Rise time, output data		3		3	ns
	$t_{F(data)}$	Fall time, output data		3		3	ns
HSSD5	$t_{d(CLKOH-CMD)}$	Delay time, mmc1_clk rising clock edge to mmc1_cmd transition	3.72	14.11	4.13	34.53	ns
HSSD6	$t_{d(CLKOH-DATx)}$	Delay time, mmc1_clk rising clock edge to mmc1_dat[n:0](6) transition	3.72	14.11	4.13	34.53	ns

(1) Related with the output clock maximum and minimum frequencies programmable in MMC module.

(2) PO = output clock period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) The X parameter is defined as follows:

CLKD	X
1 or Even	0.5
Odd	(trunk[CLKD/2]+1)/CLKD

All required details about clock division factor CLKD can be found in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(5) The Y parameter is defined as follows:

CLKD	Y
1 or Even	0.5
Odd	(trunk[CLKD/2])/CLKD

All required details about clock division factor CLKD can be found in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(6) In mmc1_dat[n:0], n is equal to 3.

(7) See Section 4.3.4, *Processor Clocks*.

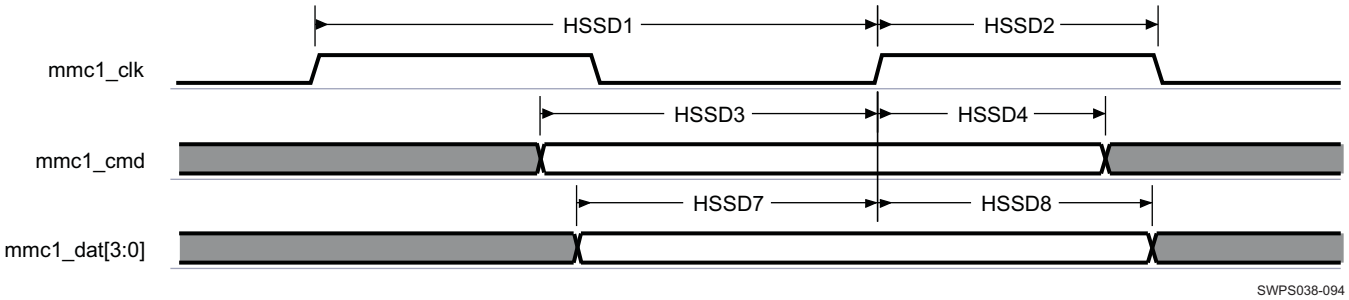

Figure 6-65. MMC1 Interface—High-Speed SD Mode—Data/Command Receive

Figure 6-66. MMC1 Interface—High-Speed SD Mode—Data/Command Transmit

6.6.8.1.3 MMC1 Interface—Standard SD Mode

Table 6-116 and Table 6-117 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-67 and Figure 6-68).

Table 6-115. MMC1 Interface Timing Conditions—Standard SD Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	10	ns
t_F	Input signal fall time	10	ns
Output Condition			
C_{LOAD}	Output load capacitance(1)	40	pF

(1) Buffer strength configuration: SPEEDCTRL = 1.

Table 6-116. MMC1 Interface Timing Requirements—Standard SD Mode(1) (2) (4)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
MMC1 Interface (1.8-V IO)							
SD3	$t_{su(CMDV-CLKIH)}$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge	3.3		21.9		ns
SD4	$t_{h(CLKIH-CMDIV)}$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge	18.1		36.7		ns
SD7	$t_{su(DATxV-CLKIH)}$	Setup time, mmc1_dat[n:0](3) valid before mmc1_clk rising clock edge	3.3		21.9		ns
SD8	$t_{h(CLKIH-DATxIV)}$	Hold time, mmc1_dat[n:0](3) valid after mmc1_clk rising clock edge	18.1		36.7		ns
MMC1 Interface (3.0-V IO)							
SD3	$t_{su(CMDV-CLKIH)}$	Setup time, mmc1_cmd valid before mmc1_clk rising clock edge	3.3		21.9		ns

Table 6-116. MMC1 Interface Timing Requirements—Standard SD Mode[1] [2] [4] (continued)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
SD4	$t_{h(CLKIH-CMDIV)}$	Hold time, mmc1_cmd valid after mmc1_clk rising clock edge	18.1		36.7		ns
SD7	$t_{su(DATxV-CLKIH)}$	Setup time, mmc1_dat[n:0][3] valid before mmc1_clk rising clock edge	3.3		21.9		ns
SD8	$t_{h(CLKIH-DATxIV)}$	Hold time, mmc1_dat[n:0][3] valid after mmc1_clk rising clock edge	18.1		36.7		ns

(1) Timing parameters are referred to output clock specified in Table 6-117.

(2) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified in Table 6-117.

(3) In mmc1_dat[n:0], n is equal to 3.

(4) See Section 4.3.4, *Processor Clocks*.

Table 6-117. MMC1 Interface Switching Characteristics—Standard SD Mode[7]

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
Standard SD Mode							
SD1	$t_{c(clk)}$	Frequency[1], output clock period		24		12	MHz
SD2	$t_{W(clkH)}$	Typical pulse duration, output clock high	X[4]*PO[2]		X[4]*PO[2]		ns
SD2	$t_{W(clkL)}$	Typical pulse duration, output clock low	Y[5]*PO[2]		Y[5]*PO[2]		ns
	$t_{dc(clk)}$	Duty cycle error, output clock		2083.33		4166.67	ps
	$t_{J(clk)}$	Jitter standard deviation[3], output clock		200		200	ps
MMC1 Interface (1.8-V)							
	$t_{R(clk)}$	Rise time, output clock		10		10	ns
	$t_{F(clk)}$	Fall time, output clock		10		10	ns
	$t_{R(data)}$	Rise time, output data		10		10	ns
	$t_{F(data)}$	Fall time, output data		10		10	ns
SD5	$t_{d(CLKOH-CMD)}$	Delay time, mmc1_clk rising clock edge to mmc1_cmd transition	6.13	35.53	6.3	77.03	ns
SD6	$t_{d(CLKOH-DATx)}$	Delay time, mmc1_clk rising clock edge to mmc1_dat[n:0][6] transition	6.13	35.53	6.3	77.03	ns
MMC1 Interface (3.0-V)							
	$t_{R(clk)}$	Rise time, output clock		10		10	ns
	$t_{F(clk)}$	Fall time, output clock		10		10	ns
	$t_{R(data)}$	Rise time, output data		10		10	ns
	$t_{F(data)}$	Fall time, output data		10		10	ns
SD5	$t_{d(CLKOH-CMD)}$	Delay time, mmc1_clk rising clock edge to mmc1_cmd transition	6.13	35.53	6.3	77.03	ns
SD6	$t_{d(CLKOH-DATx)}$	Delay time, mmc1_clk rising clock edge to mmc1_dat[n:0][6] transition	6.13	35.53	6.3	77.03	ns

(1) Related with the output clock maximum and minimum frequencies programmable in MMC module.

(2) PO = output clock period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) The X parameter is defined as follows:

CLKD	X
1 or Even	0.5
Odd	(trunk[CLKD/2]+1)/CLKD

All required details about clock division factor CLKD can be found in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(5) The Y parameter is defined as follows:

CLKD	Y
1 or Even	0.5
Odd	(trunk[CLKD/2])/CLKD

All required details about clock division factor CLKD can be found in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(6) In mmc1_dat[n:0], n is equal to 3.

(7) See Section 4.3.4, *Processor Clocks*.

			MIN	MAX	MIN	MAX	
Standard SDIO Mode							
SD1	$t_{c(clk)}$	Frequency(1), output clock period		0.4		0.4	MHz
SD2	$t_{W(clkH)}$	Typical pulse duration, output clock high	X(5) * PO(2)		X(5) * PO(2)		ns
SD2	$t_{W(clkL)}$	Typical pulse duration, output clock low	Y(6) * PO(2)		Y(6) * PO(2)		ns
	$t_{dc(clk)}$	Duty cycle error, output clock		125		125	ns
	$t_{J(clk)}$	Jitter standard deviation(3), output clock		200		200	ps
	$t_{R(clk)}$	Rise time, output clock		10		10	ns
	$t_{F(clk)}$	Fall time, output clock		10		10	ns
	$t_{R(data)}$	Rise time, output data		10		10	ns
	$t_{F(data)}$	Fall time, output data		10		10	ns
SD5	$t_{d(CLKOH-CMD)}$	Delay time, mmcx_clk rising clock edge to mmcx_cmd transition	6.3	2492.7	6.3	77.03	ns

(1) Related to the output mmcx_clk maximum and minimum frequency.

(2) P = output mmcx_clk period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) Corresponding figures showing timing parameters are common with other interface modes (see SDIO, HS SDIO modes).

(5) The X parameter is defined as follows:

CLKD	X
1 or Even	0.5
Odd	(trunk[CLKD/2]+1)/CLKD

All required details about clock division factor CLKD can be found in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(6) The Y parameter is defined as follows:

CLKD	Y
1 or Even	0.5
Odd	(trunk[CLKD/2])/CLKD

All required details about clock division factor CLKD can be found in the *AM/DM37x Multimedia Device Technical Reference Manual* (literature number SPRUGN4).

(7) In mmcx, x is equal to 2 or 3.

6.6.8.1.7 MMC2 and MMC3 Interfaces—High-Speed SDIO Mode

Table 6-128 and Table 6-129 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-73 and Figure 6-74).

Table 6-127. MMC2 and MMC3 Interfaces Timing Conditions—High-Speed SDIO Mode

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Input Conditions				
t_R	Input signal rise time	0.18	5.69	ns
t_F	Input signal fall time	0.19	5.70	ns
Output Condition				
C_{LOAD}	Output load capacitance(1)	5		pF

(1) Buffer strength configuration for MMC2 and MMC3: LB0 = 0.

(3) In mmx_clk, x is equal to 2 or 3.

6.6.9 Test Interfaces

6.6.9.1 Embedded Trace Macro Interface (ETM)

Table 6-137 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-79).

Table 6-136. ETM Timing Conditions—Transmit Mode

TIMING CONDITION PARAMETER		VALUE		UNIT
		MIN	MAX	
Output Condition				
C_{LOAD}	Output load capacitance(1)		10	pF

(1) Buffer strength configuration: LB0 = 1.

Table 6-137. ETM Switching Characteristics—Transmit Mode(4)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
TPIU1	$1 / t_{c(clk)}$	Frequency(3), output clock etk_clk		166		166	MHz
TPIU2	$t_{w(clkH)}$	Pulse duration, output clock etk_clk high	0.5P(1)		0.5P(1)		ns
TPIU3	$t_{w(clkL)}$	Pulse duration, output clock etk_clk low	0.5P(1)		0.5P(1)		ns
	$t_{dc(clk)}$	Duty cycle error, output clock etk_clk	–301	301	–301	301	ps
	$t_{J(clk)}$	Jitter standard deviation(2), output clock etk_clk		65		65	ps
	$t_{R(clk)}$	Rise time, output clock etk_clk		1.2		1.2	ns
	$t_{F(clk)}$	Fall time, output clock etk_clk		1.2		1.2	ns
TPIU4	$t_{d(clk-ctl)}$	Delay time, output clock etk_clk low/high to output control etk_ctl transition		0.839		0.839	ns
TPIU5	$t_{d(clkH-d)}$	Delay time, output clock etk_clk low/high to output data etk_d[15:0] transition		0.839		0.839	ns
	$t_{R(d/ctl)}$	Rise time, output data etk_d[15:0] and output control etk_ctl		1.2		1.2	ns
	$t_{F(d/ctl)}$	Fall time, output data etk_d[15:0] and output control etk_ctl		1.2		1.2	ns

(1) P = etk_clk period in ns

(2) The jitter probability density can be approximated by a Gaussian function.

(3) Related with the etm_clk maximum frequency.

(4) See Section 4.3.4, *Processor Clocks*.

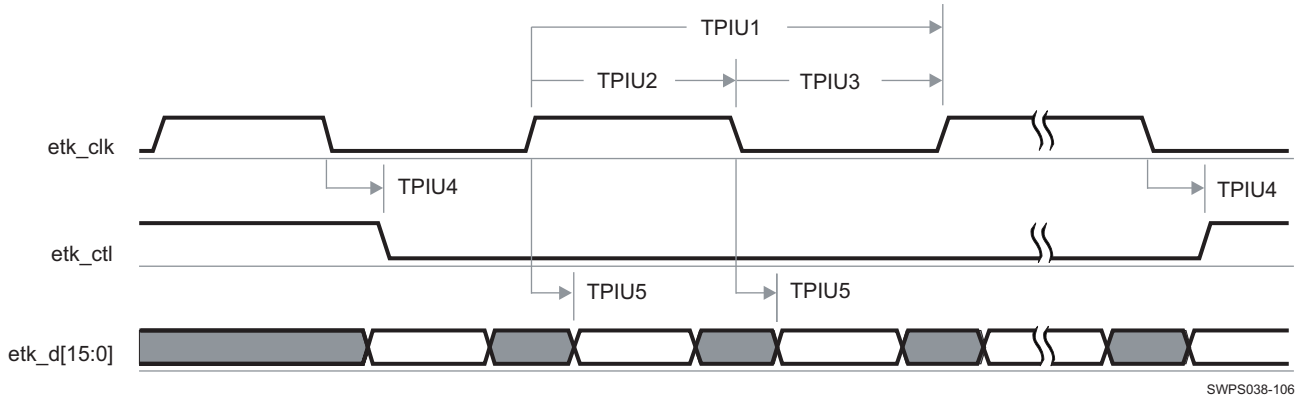

Figure 6-79. ETM—Transmit Mode

6.6.9.2 System Debug Trace Interface (SDTI)

The System Debug Trace Interface (SDTI) module provides real-time software tracing functionality to the device. The trace interface has four trace data pins and a trace clock pin.

This interface is a dual-edge interface:

- The data are available on rising and falling edge of sdti_clk.
- But can be also configured in single-edge mode where data are available on the falling edge of sdti_clk.

Serial interface operates in clock stop regime: serial clock is not free-running; when there is no trace data, there is no trace clock.

6.6.9.2.1 SDTI—Dual-Edge Mode

Table 6-139 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-80).

Table 6-138. SDTI Timing Conditions—Dual-Edge Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Output Condition			
C_{LOAD}	Output load capacitance(1)	25	pF

(1) Buffer strength configuration: LB0 = 1.

Table 6-139. SDTI Switching Characteristics—Dual-Edge Mode(2)

NO.	PARAMETER			OPP100		OPP50		UNIT
				MIN	MAX	MIN	MAX	
SD1	$1 / t_{c(clk)}$	Frequency, output clock sdti_clk			34.5		34.5	MHz
SD2	$t_{w(clk)}$	Pulse duration, output clock sdti_clk high or low		0.5P(1) – 1.2	0.5P(1) + 1.2	0.5P(1) – 1.2	0.5P(1) + 1.2	ns
SD3	$t_{d(clk-txd)}$	Delay time, output clock sdti_clk transition to output data sdti_txd[3:0] transition	Multiplexing mode on etk pins	2.3	10.9	2.3	10.9	ns
			Multiplexing mode on jtag_emu pins	2.3	13.9	2.3	13.9	

(1) P = sdti_clk clock period in ns

(2) See Section 4.3.4, *Processor Clocks*.

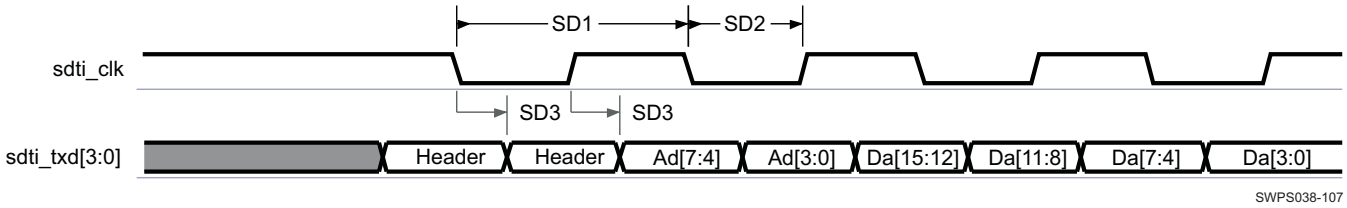

Figure 6-80. SDTI—Dual-Edge Mode

6.6.9.2.2 SDTI—Single-Edge Mode

Table 6-141 assumes testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-81).

Table 6-140. SDTI Timing Conditions—Single-Edge Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Output Condition			
C_{LOAD}	Output load capacitance(1)	25	pF

(1) Buffer strength configuration: LB0 = 1.

Table 6-141. SDTI Switching Characteristics—Single-Edge Mode(2)

				MIN	MAX	MIN	MAX	
SD1	$1 / t_{c(clk)}$	Frequency, output clock sdti_clk			34.5		34.5	MHz
SD2	$t_{w(clk)}$	Pulse duration, output clock sdti_clk high or low		0.5P(1) – 1.2	0.5P(1) + 1.2	0.5P(1) – 1.2	0.5P(1) + 1.2	ns
SD3	$t_{d(clk-txd)}$	Delay time, output clock sdti_clk transition to output data sdti_txd[3:0] transition	Multiplexing mode on etk pins	2.3	26.5	2.3	26.5	ns
			Multiplexing mode on jtag_emu pins	2.3	33.2	2.3	33.2	

(1) P = sdti_clk clock period in ns

(2) See Section 4.3.4, *Processor Clocks*.

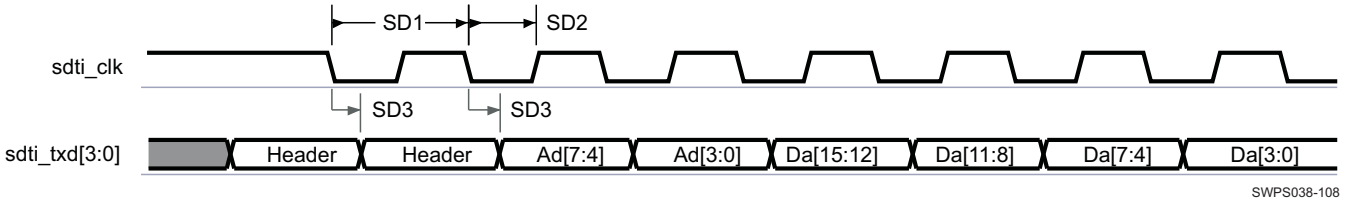

Figure 6-81. SDTI—Single-Edge Mode

6.6.9.3 JTAG Interface (JTAG)

The JTAG TAP controller handles standard IEEE JTAG interfaces. The following section defines the timing requirements for several tools used to test the device as:

- Free-running clock tool, like XDS560 and XDS510 tools
- Adaptive clock tool, like RealView® ICE tool and Lauterbach™ tool

6.6.9.3.1 JTAG—Free-Running Clock Mode

Table 6-143 and Table 6-144 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-82).

Table 6-142. JTAG Timing Conditions—Free-Running Clock Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	5	ns
t_F	Input signal fall time	5	ns
Output Condition			
C_{LOAD}	Output load capacitance	30	pF

Table 6-143. JTAG Timing Requirements—Free-Running Clock Mode[5] [6]

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
JT4	$1 / t_{c(tck)}$	Frequency[1], input clock jtag_tck		50		50	MHz
JT5	$t_{w(tckL)}$	Pulse duration, input clock jtag_tck low	0.5P[2]		0.5P[2]		ns
JT6	$t_{w(tckH)}$	Pulse duration, input clock jtag_tck high	0.5P[2]		0.5P[2]		ns
	$t_{dc(tck)}$	Duty cycle error, input clock jtag_tck	–1250	1250	–1667	1667	ps
	$t_{J(tck)}$	Cycle jitter[3], input clock jtag_tck	–1250	1250	–1667	1667	ps
JT7	$t_{su(tdiV-rtckH)}$	Setup time, input data jtag_tdi valid before output clock jtag_rtck high	1.6		1.6		ns
JT8	$t_{h(tdiV-rtckH)}$	Hold time, input data jtag_tdi valid after output clock jtag_rtck high	0.7		1.0		ns
JT9	$t_{su(tmsV-rtckH)}$	Setup time, input mode select jtag_tms_tmsc valid before output clock jtag_rtck high	1.6		1.6		ns
JT10	$t_{h(tmsV-rtckH)}$	Hold time, input mode select jtag_tms_tmsc valid after output clock jtag_rtck high	0.7		1.0		ns
JT12	$t_{su(emuxV-rtckH)}$	Setup time, input emulation jtag_emux[4] valid before output clock jtag_rtck high	14.4		19.6		ns
JT13	$t_{h(emuxV-rtckH)}$	Hold time, input emulation jtag_emux[4] valid after output clock jtag_rtck high	2.0		2.7		ns

(1) Related with the input maximum frequency supported by the JTAG module.

(2) P = input clock jtag _tck period in ns

(3) Maximum cycle jitter supported by input clock jtag _tck.

(4) In jtag_emux, x is equal to 0 or 1.

(5) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.

(6) See Section 4.3.4, *Processor Clocks*.

Table 6-144. JTAG Switching Characteristics—Free-Running Clock Mode[5]

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
JT1	$1 / t_{c(rtck)}$	Frequency[1], output clock jtag_rtck		50		50	MHz
JT2	$t_{w(rtckL)}$	Pulse duration, output clock jtag_rtck low	0.5P[2]		0.5P[2]		ns
JT3	$t_{w(rtckH)}$	Pulse duration, output clock jtag_rtck high	0.5P[2]		0.5P[2]		ns
	$t_{dc(rtck)}$	Duty cycle error, output clock jtag_rtck	–1250	1250	–1667	1667	ps
	$t_{J(rtck)}$	Jitter standard deviation[3], output clock jtag_rtck		33.3		33.3	ps
	$t_{R(rtck)}$	Rise time, output clock jtag_rtck		0		0	ns
	$t_{F(rtck)}$	Fall time, output clock jtag_rtck		0		0	ns
JT11	$t_{d(rtckL-tdoV)}$	Delay time, output clock jtag_rtck low to output data jtag_tdo valid	–5.8	5.8	–7.9	7.9	ns
	$t_{R(tdo)}$	Rise time, output data jtag_tdo		0		0	ns
	$t_{F(tdo)}$	Fall time, output data jtag_tdo		0		0	ns
JT14	$t_{d(rtckH-emuxV)}$	Delay time, output clock jtag_rtck high to output emulation ,jtag_emux[4] valid	2.7	15.1	2.7	20.4	ns

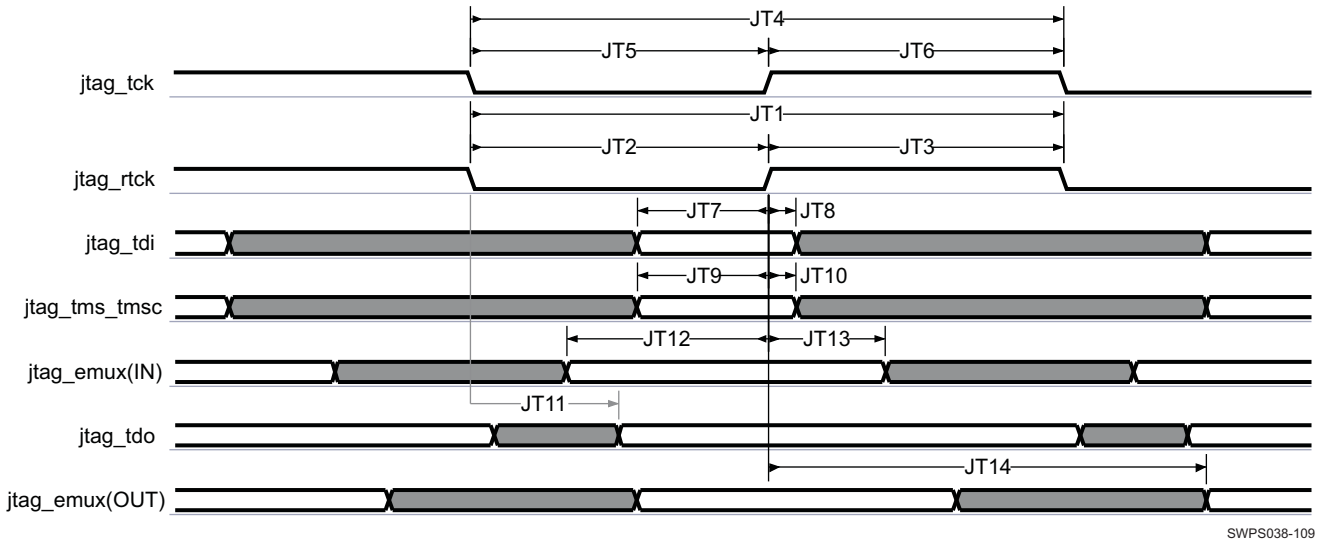
(1) Related with the jtag_rtck maximum frequency.

(2) P = output clock jtag _rtck period in ns

(3) The jitter probability density can be approximated by a Gaussian function.

(4) In jtag_emux, x is equal to 0 or 1.

(5) See Section 4.3.4, *Processor Clocks*.



(1) In jtag_emux, x is equal to 0 or 1.

Figure 6-82. JTAG—Free-Running Clock Mode

6.6.9.3.2 JTAG—Adaptative Clock Mode

Table 6-146 and Table 6-147 assume testing over the recommended operating conditions and electrical characteristic conditions below (see Figure 6-83).

Table 6-145. JTAG Timing Conditions—Adaptative Clock Mode

TIMING CONDITION PARAMETER		VALUE	UNIT
Input Conditions			
t_R	Input signal rise time	5	ns
t_F	Input signal fall time	5	ns
Output Condition			
C_{LOAD}	Output load capacitance	30	pF

Table 6-146. JTAG Timing Requirements—Adaptative Clock Mode(4) (5)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
JA4	$1 / t_{c(tck)}$	Frequency(1), input clock jtag_tck		50		50	MHz
JA5	$t_{w(tckL)}$	Pulse duration, input clock jtag_tck low	0.5P(2)		0.5P(2)		ns
JA6	$t_{w(tckH)}$	Pulse duration, input clock jtag_tck high	0.5P(2)		0.5P(2)		ns
	$t_{dc(lclk)}$	Duty cycle error, input clock jtag_tck	–2500	2500	–2500	2500	ps
	$t_{J(lclk)}$	Cycle jitter(3), input clock jtag_tck	–1500	1500	–1500	1500	ps
JA7	$t_{su(tdiV-tckH)}$	Setup time, input data jtag_tdi valid before input clock jtag_tck high	13.8		13.8		ns
JA8	$t_{h(tdiV-tckH)}$	Hold time, input data jtag_tdi valid after input clock jtag_tck high	13.8		13.8		ns
JA9	$t_{su(tmsV-tckH)}$	Setup time, input mode select jtag_tms_tmsc valid before input clock jtag_tck high	13.8		13.8		ns
JA10	$t_{h(tmsV-tckH)}$	Hold time, input mode select jtag_tms_tmsc valid after input clock jtag_tck high	13.8		13.8		ns

(1) Related with the input maximum frequency supported by the JTAG module
(2) P = input clock jtag _tck period in ns
(3) Maximum cycle jitter supported by input clock jtag _tck.
(4) The timing requirements are assured for the cycle jitter and duty cycle error conditions specified.
(5) See Section 4.3.4, *Processor Clocks*.

Table 6-147. JTAG Switching Characteristics—Adaptative Clock Mode(4)

NO.	PARAMETER		OPP100		OPP50		UNIT
			MIN	MAX	MIN	MAX	
JA1	$1 / t_{c(rtck)}$	Frequency(1), output clock jtag_rtck		50		50	MHz
JA2	$t_{w(rtckL)}$	Pulse duration, output clock jtag_rtck low	0.5P(2)		0.5P(2)		ns
JA3	$t_{w(rtckH)}$	Pulse duration, output clock jtag_rtck high	0.5P(2)		0.5P(2)		ns
	$t_{dc(rtck)}$	Duty cycle error, output clock jtag_rtck	–2500	2500	–2500	2500	ps
	$t_{J(rtck)}$	Jitter standard deviation(3), output clock jtag_rtck		33.3		33.3	ps
	$t_{R(rtck)}$	Rise time, output clock jtag_rtck		0		0	ns
	$t_{F(rtck)}$	Fall time, output clock jtag_rtck		0		0	ns
JA11	$t_{d(rtckL-tdoV)}$	Delay time, output clock jtag_rtck low to output data jtag_tdo valid	–14.6	14.6	–14.6	14.6	ns

(1) Related to the jtag _rtck maximum frequency programmable.
(2) P = output clock jtag _rtck period in ns
(3) The jitter probability density can be approximated by a Gaussian function.
(4) See Section 4.3.4, *Processor Clocks*.

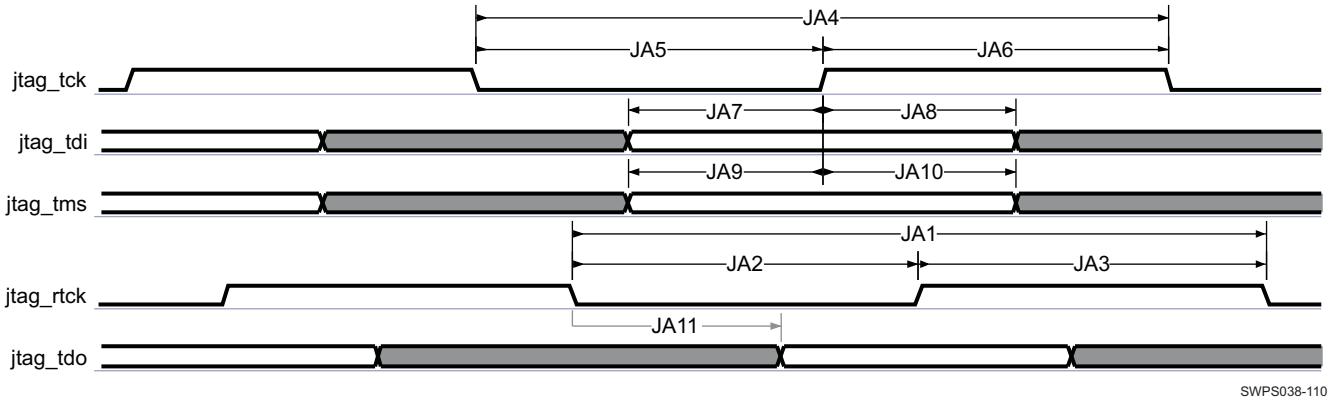


Figure 6-83. JTAG—Adaptative Clock Mode

7 Package Characteristics

7.1 Package Thermal Characteristics

Table 7-1 and Table 7-2 provide the thermal resistance characteristics for the packages used on this device.

Note: This table provides simulation data and may not represent actual use-case values.

Table 7-1. Thermal Resistance Characteristics 800MHz ARM Operation-4Gb DDR + Flash

PACKAGE	Power (W)(5)	θ_{JA}(°C/W)(2)	θ_{JB}(°C/W)(3)	θ_{JC}(°C/W)(4)	BOARD TYPE
CBP Package	1.42	20.06	6.44	(6)	2S2P(1)
CBC Package	1.42	19.97	7.76	(6)	2S2P(1)
CUS Package	1.05	24.75	11.06	7.06	2S2P(1)

(1) The board types are defined by JEDEC (reference JEDEC standard JESD51-9, Test Board for Array Surface Mount Package Thermal Measurements).

(2) θ_{JA} (Theta-JA) = Thermal Resistance Junction-to-Ambient, °C/W

(3) θ_{JB} (Theta-JB) = Thermal Resistance Junction-to-Board, °C/W

(4) θ_{JC} (Theta-JC) = Thermal Resistance Junction-to-Board, °C/W

(5) These power numbers are based on simulation results for DM37x. Power numbers for CBP and CBC packages include the DM37x device and POP memory. CUS package is DM37x only.

(6) Not applicable since these packages have memory package mounted on top.

Table 7-2. Thermal Resistance Characteristics 1GHz ARM Operation-8Gb DDR

PACKAGE	Power (W)(5)	θ_{JA}(°C/W)(2)	θ_{JB}(°C/W)(3)	θ_{JC}(°C/W)(4)	BOARD TYPE
CBP Package	2.06	19.51	6.19	(6)	2S2P(1)
CBC Package	2.06	20.11	8.01	(6)	2S2P(1)
CUS Package	1.4	24.75	11.06	7.06	2S2P(1)

(1) The board types are defined by JEDEC (reference JEDEC standard JESD51-9, Test Board for Array Surface Mount Package Thermal Measurements).

(2) θ_{JA} (Theta-JA) = Thermal Resistance Junction-to-Ambient, °C/W

(3) θ_{JB} (Theta-JB) = Thermal Resistance Junction-to-Board, °C/W

(4) θ_{JC} (Theta-JC) = Thermal Resistance Junction-to-Board, °C/W

(5) These power numbers are based on simulation results for DM37x. Power numbers for CBP and CBC packages include the DM37x device and POP memory. CUS package is DM37x only.

(6) Not applicable since these packages have memory package mounted on top.

7.2 Device Support

7.2.1 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DM37x processors and support tools. Each device has one of three prefixes: X, P, or null (no prefix). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices/tools (TMDS).

Device development evolutionary flow:

X Experimental device that is not necessarily representative of the final devices electrical specifications and may not use production assembly flow. (TMX definition)

P Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications. (TMP definition)

null Production version of the silicon die that is fully qualified. (TMS definition)

Support tool development evolutionary flow:

TMDX Development support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully qualified development support product.

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

Developmental product is intended for internal evaluation purposes.

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TIs standard warranty applies.

Predictions show that prototype devices (X or P), have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

For additional description of the device nomenclature markings, see the *Processor Silicon Errata*.

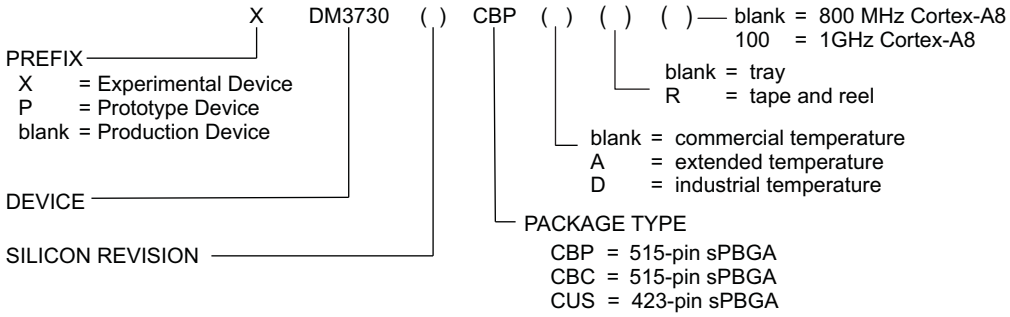

Figure 7-1. Device Nomenclature

7.2.2 Documentation Support

7.2.2.1 Related Documentation from Texas Instruments

The following documents describe the DM3730/25 Digital Media Processor. Copies of these documents are available on the Internet at www.ti.com. Tip: Enter the literature number in the search box provided at www.ti.com.

The current documentation that describes the DM3730/25 Digital Media Processor, related peripherals, and other technical collateral, is available in the product folder at: www.ti.com.

SPRUGN4 . Collection of documents providing detailed information on the Sitara™ architecture including power, reset, and clock control, interrupts, memory map, and switch fabric interconnect. Detailed information on the microprocessor unit (MPU) subsystem as well a functional description of the peripherals supported on DM3730/25devices is also included.

7.2.2.1.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E Community ***TI's Engineer-to-Engineer (E2E) Community.*** Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

TI Embedded Processors Wiki ***Texas Instruments Embedded Processors Wiki.*** Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

7.2.2.2 Related Documentation from Other Sources

The following documents are related to the DM3730, DM3725 Digital Media Processors. Copies of these documents can be obtained directly from the internet or from your Texas Instruments representative.

Cortex-A8 Technical Reference Manual. This is the technical reference manual for the Cortex-A8 processor. A copy of this document can be obtained via the internet at http://infocenter.arm.com. Please see the *DM3730, DM3725 Digital Media Processors Silicon Errata* (literature number SPRZ319) to determine the revision of the Cortex-A8 core used on your device.

ARM Core Cortex™-A8 (AT400/AT401) Errata Notice. Provides a list of advisories for the different revisions of the Cortex-A8 processor. Contact your TI representative for a copy of this document. Please see the *DM3730, DM3725 Digital Media Processors Silicon Errata* (literature number SPRZ319) to determine the revision of the Cortex-A8 core used on your device.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

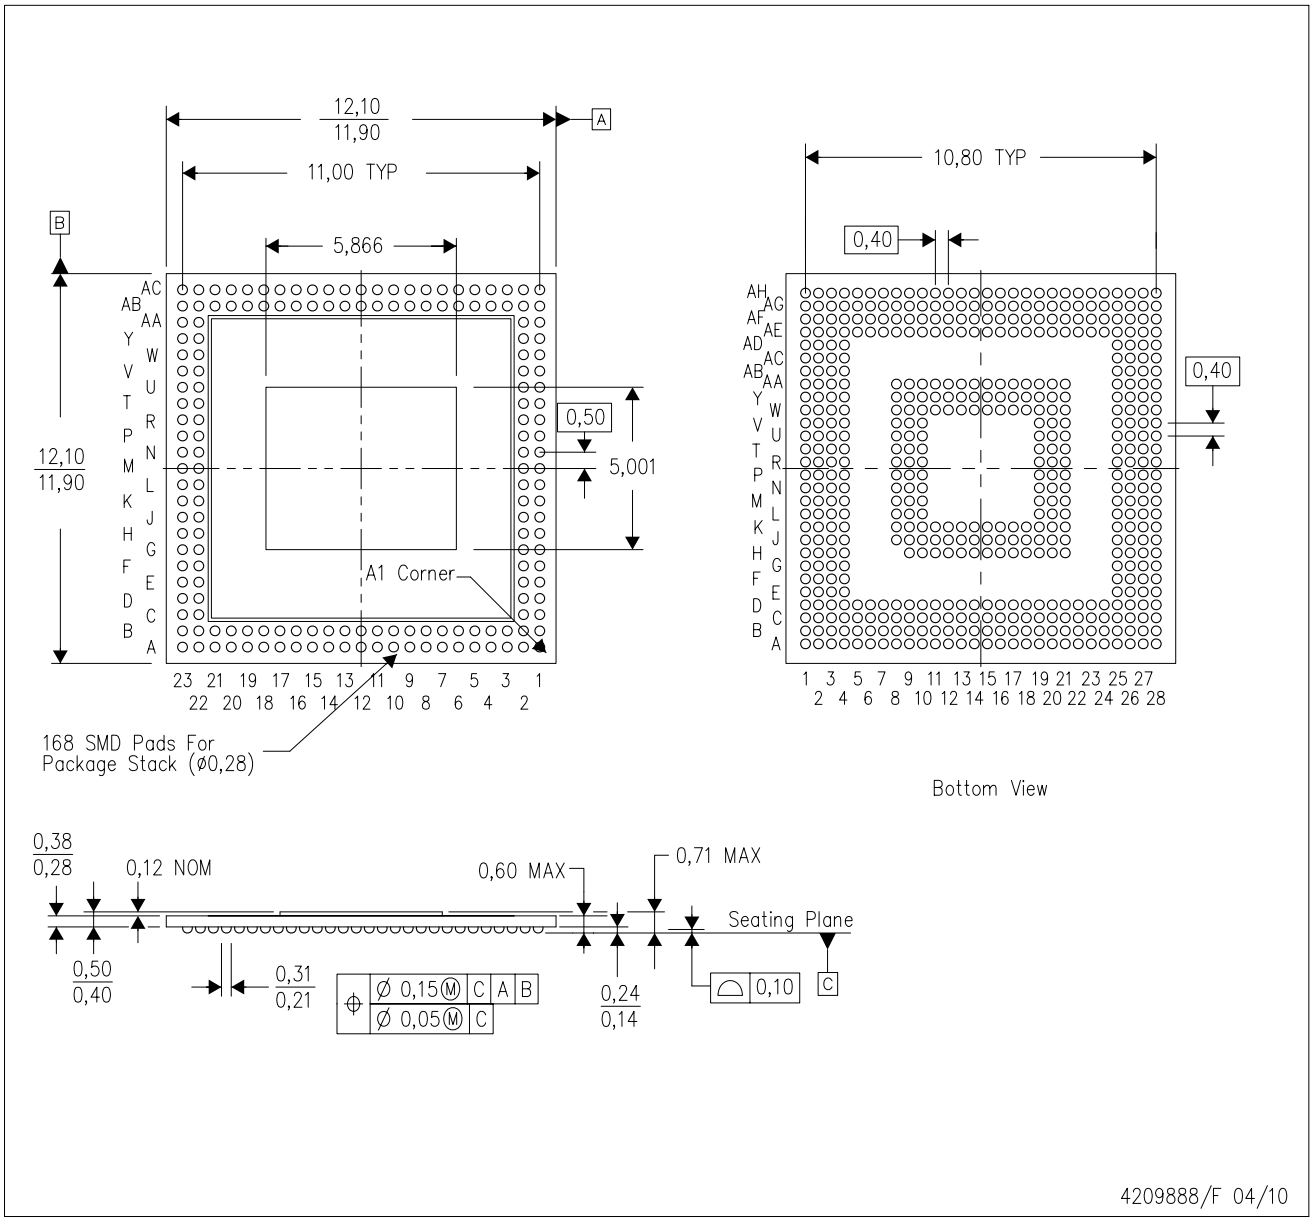
(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

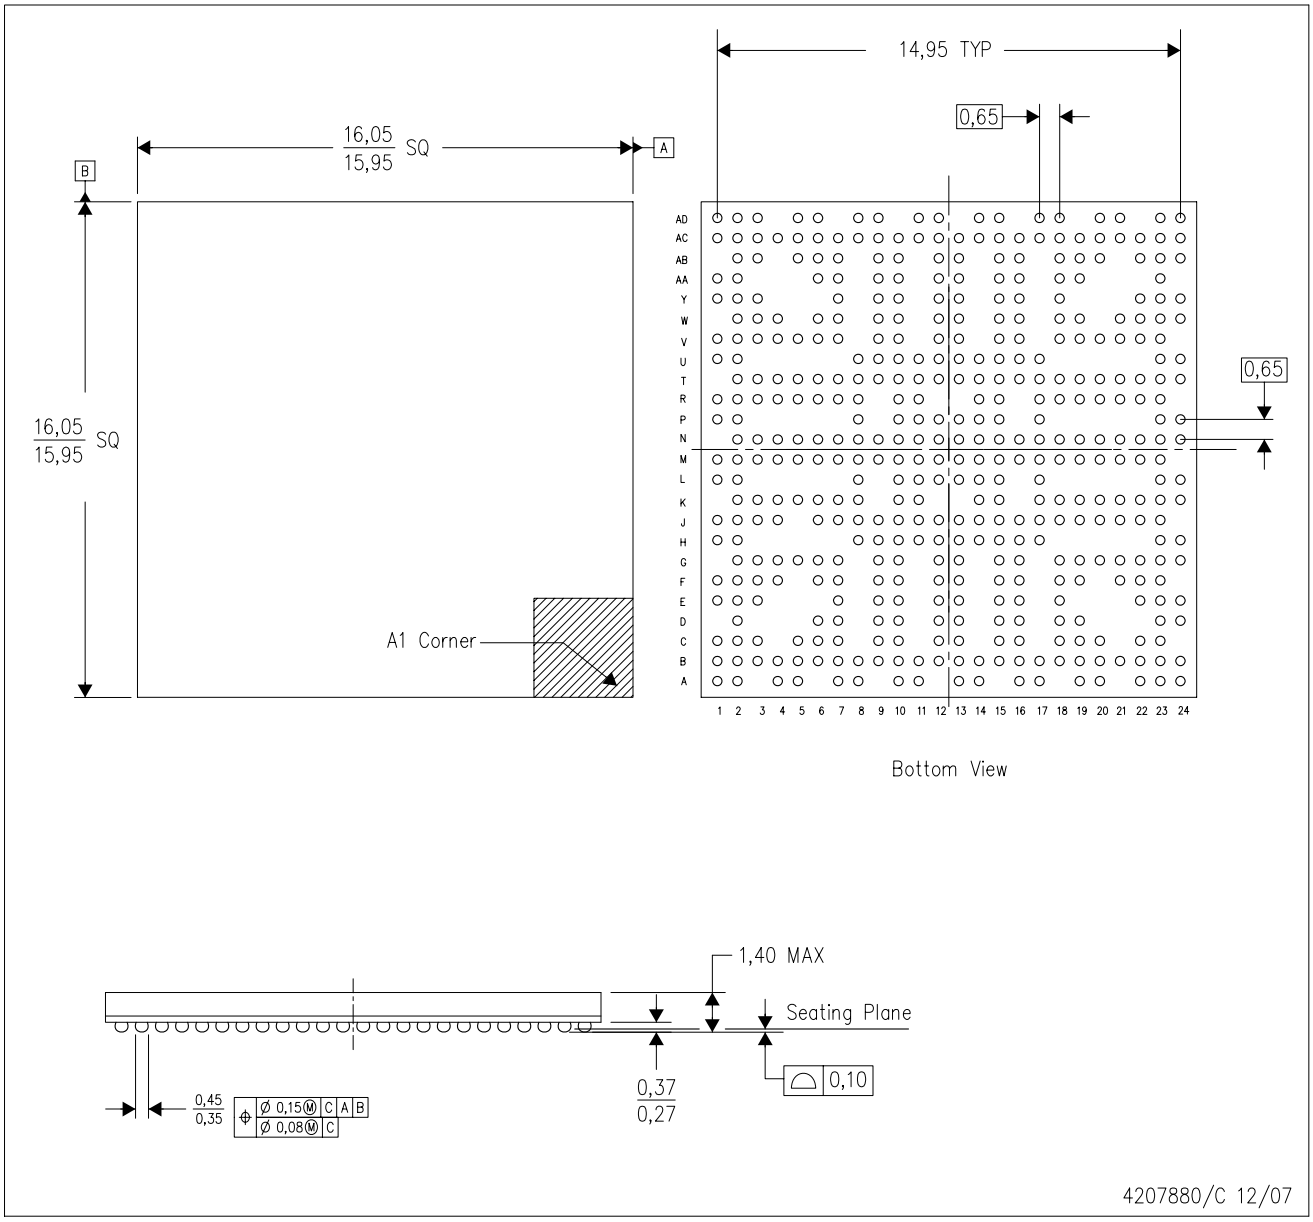
(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

CBP (S–PBGA–N515) PLASTIC BALL GRID ARRAY



NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. Flip chip application only.
D. Pb–free die bump and solder ball.

CUS (S–PBGA–N423) PLASTIC BALL GRID ARRAY



NOTES:

B. This drawing is subject to change without notice.
C. Flip chip application only.
D. Lead–free die bump and solder ball.

IMPORTANT NOTICE FOR TI DESIGN INFORMATION AND RESOURCES

Texas Instruments Incorporated ('TI") technical, application or other design advice, services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using any particular TI Resource in any way, you (individually or, if you are acting on behalf of a company, your company) agree to use it solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources.

You understand and agree that you remain responsible for using your independent analysis, evaluation and judgment in designing your applications and that you have full and exclusive responsibility to assure the safety of your applications and compliance of your applications (and of all TI products used in or for your applications) with all applicable regulations, laws and other applicable requirements. You represent that, with respect to your applications, you have all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. You agree that prior to using or distributing any applications that include TI products, you will thoroughly test such applications and the functionality of such TI products as used in such applications. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

You are authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING TI RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY YOU AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

You agree to fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of your non-compliance with the terms and provisions of this Notice.

This Notice applies to TI Resources. Additional terms apply to the use and purchase of certain types of materials, TI products and services. These include; without limitation, TI's standard terms for semiconductor products http://www.ti.com/sc/docs/stdterms.htm), evaluation modules, and samples (http://www.ti.com/sc/docs/sampterms.htm).
