DRV8802-Q1 Automotive DC Motor-Driver IC

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results
  - Device Temperature Grade 1: –40°C to 125°C Ambient Operating Temperature
  - Device HBM ESD Classification Level 2
  - Device CDM ESD Classification Level C4B
- Dual H-Bridge Current-Control Motor Driver
  - Drives Two DC Motors
  - Brake Mode
  - Two-Bit Winding Current Control Allows Up to 4 Current Levels
  - Low MOSFET On-Resistance
- 1.6-A Maximum Drive Current at 24 V, 25°C
- Built-In 3.3-V Reference Output
- Industry Standard Parallel Digital Control Interface
- 8-V to 45-V Operating Supply Voltage Range
- Thermally Enhanced Surface Mount Package

2 Applications

- Automotive HVAC
- Automotive Valves
- Automotive Infotainment

3 Description

The DRV8802-Q1 device provides an integrated motor driver solution for automotive applications. The device has two H-bridge drivers, and is intended to drive DC motors. The output driver block for each consists of N-channel power MOSFET's configured as H-bridges to drive the motor windings. The DRV8802-Q1 device can supply up to 1.6-A peak or 1.1-A RMS output current (with proper heatsinking at 24 V and 25°C) per H-bridge.

A simple parallel digital control interface is compatible with industry-standard devices. Decay mode is programmable to allow braking or coasting of the motor when disabled.

Internal shutdown functions are provided for over current protection, short circuit protection, under voltage lockout and overtemperature.

The DRV8802-Q1 device is available in a 28-pin HTSSOP package with PowerPAD™ (Eco-friendly: RoHS & no Sb/Br).

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV8802-Q1	HTSSOP (28)	9.70 mm × 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

Pin Functions

PIN		TYPE (1)	DESCRIPTION	EXTERNAL COMPONENTS OR CONNECTIONS
NAME	NO.			
POWER AND GROUND				
CP1	1	IO	Charge pump flying capacitor	Connect a 0.01-μF 50-V capacitor between CP1 and CP2.
CP2	2	IO	Charge pump flying capacitor	
GND	14 28	—	Device ground	
V3P3OUT	15	O	3.3-V regulator output	Bypass to GND with a 0.47-μF 6.3-V ceramic capacitor. Can be used to supply VREF.
VMA	4	—	Bridge A power supply	Connect to motor supply (8 to 45 V). Both pins must be connected to same supply.
VMB	11	—	Bridge B power supply	
VCP	3	IO	High-side gate drive voltage	Connect a 0.1-μF 16-V ceramic capacitor and a 1-MΩ resistor to VMx.
CONTROL				
AI0	24	I	Bridge A current set	Sets bridge A current: 00 = 100%, 01 = 71%, 10 = 38%, 11 = 0
AI1	25	I		
AENBL	21	I	Bridge A enable	Logic high to enable bridge A
APHASE	20	I	Bridge A phase (direction)	Logic high sets AOUT1 high, AOUT2 low
AVREF	12	I	Bridge A current set reference input	Reference voltage for winding current set. Can be driven individually with an external DAC for microstepping, or tied to a reference (for example, V3P3OUT).
BVREF	13	I	Bridge B current set reference input	
BI0	26	I	Bridge B current set	Sets bridge B current: 00 = 100%, 01 = 71%, 10 = 38%, 11 = 0
BI1	27	I		
BENBL	22	I	Bridge B enable	Logic high to enable bridge B
BPHASE	23	I	Bridge B phase (direction)	Logic high sets BOUT1 high, BOUT2 low
DECAY	19	I	Decay (brake) mode	Low = brake (slow decay), high = coast (fast decay)
nRESET	16	I	Reset input	Active-low reset input initializes internal logic and disables the H-bridge outputs
nSLEEP	17	I	Sleep mode input	Logic high to enable device, logic low to enter low-power sleep mode

(1) I = input, O = output, OZ = tri-state output, OD = open-drain output, IO = input/output

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1][2]

			MIN	MAX	UNIT
Power supply voltage	$V_{(VMx)}$		–0.3	47	V
Charge pump voltage	VCP, CP1, CP2		–0.3	$V_{(VMx)}$+7	V
Digital pin voltage	xPHASE, xENBL, nSLEEP, nFAULT, nRESET, xI0, xI1, DECAY		–0.5	7	V
Reference input voltage	$V_{(xVREF)}$		–0.3	4	V
Sense pin voltage	$V_{(ISENx)}$		–0.3	0.8	V
H-bridge output Current	xOUT1, xOUT2, ISENx	Peak motor drive, t < 1 μS	Internally limited		A
		Continuous motor drive[3]		1.6	A
Continuous total power dissipation			See the *Power Dissipation* section		
Operating virtual junction temperature, T_J			–40	150	°C
Operating ambient temperature, T_A			–40	125	°C

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.
(3) Power dissipation and thermal limits must be observed.

6.2 Handling Ratings

				MIN	MAX	UNIT
T_{stg}	Storage temperature range			–60	150	°C
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002[1]		–2000	2000	V
		Charged device model (CDM), per AEC Q100-011	Corner pins (1, 14, 15, and 28)	–750	750	
			Other pins	–500	500	

(1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

		MIN	MAX	UNIT
$V_{(VMx)}$	Power supply voltage[1]	8.2	45	V
$V_{(xVREF)}$	VREF input voltage[2]	1	3.5	V
$I_{(OUT1x, OUT2x)}$	H-Bridge Output Current		1.6	A
$I_{L(V3P3OUT)}$	V3P3OUT load current		1	mA

(1) All VMx pins must be connected to the same supply voltage.
(2) Operational at $V_{(xVREF)}$ between 0 V and 1 V, but accuracy is degraded.

6.4 Thermal Information

THERMAL METRIC[1]		PWP 28 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	38.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	23.3	
$R_{\theta JB}$	Junction-to-board thermal resistance	21.2	
ψ_{JT}	Junction-to-top characterization parameter	0.8	
ψ_{JB}	Junction-to-board characterization parameter	20.9	
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.6	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

7 Detailed Description

7.1 Overview

The DRV8802-Q1 device provides an integrated motor driver solution for automotive applications. The device has two H-bridge drivers, and is intended to drive DC motors. The output driver block for each consists of N-channel power MOSFET's configured as H-bridges to drive the motor windings. The DRV8802-Q1 device can supply up to 1.6-A peak or 1.1-A RMS output current (with proper heatsinking at 24 V and 25°C) per H-bridge. A simple parallel digital control interface is compatible with industry-standard devices. Decay mode is programmable to allow braking or coasting of the motor when disabled. Internal shutdown functions are provided for over current protection, short circuit protection, under voltage lockout and overtemperature.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 PWM Motor Drivers

The DRV8802-Q1 device contains two H-bridge motor drivers with current-control PWM circuitry. Figure 5 shows a block diagram of the motor control circuitry.

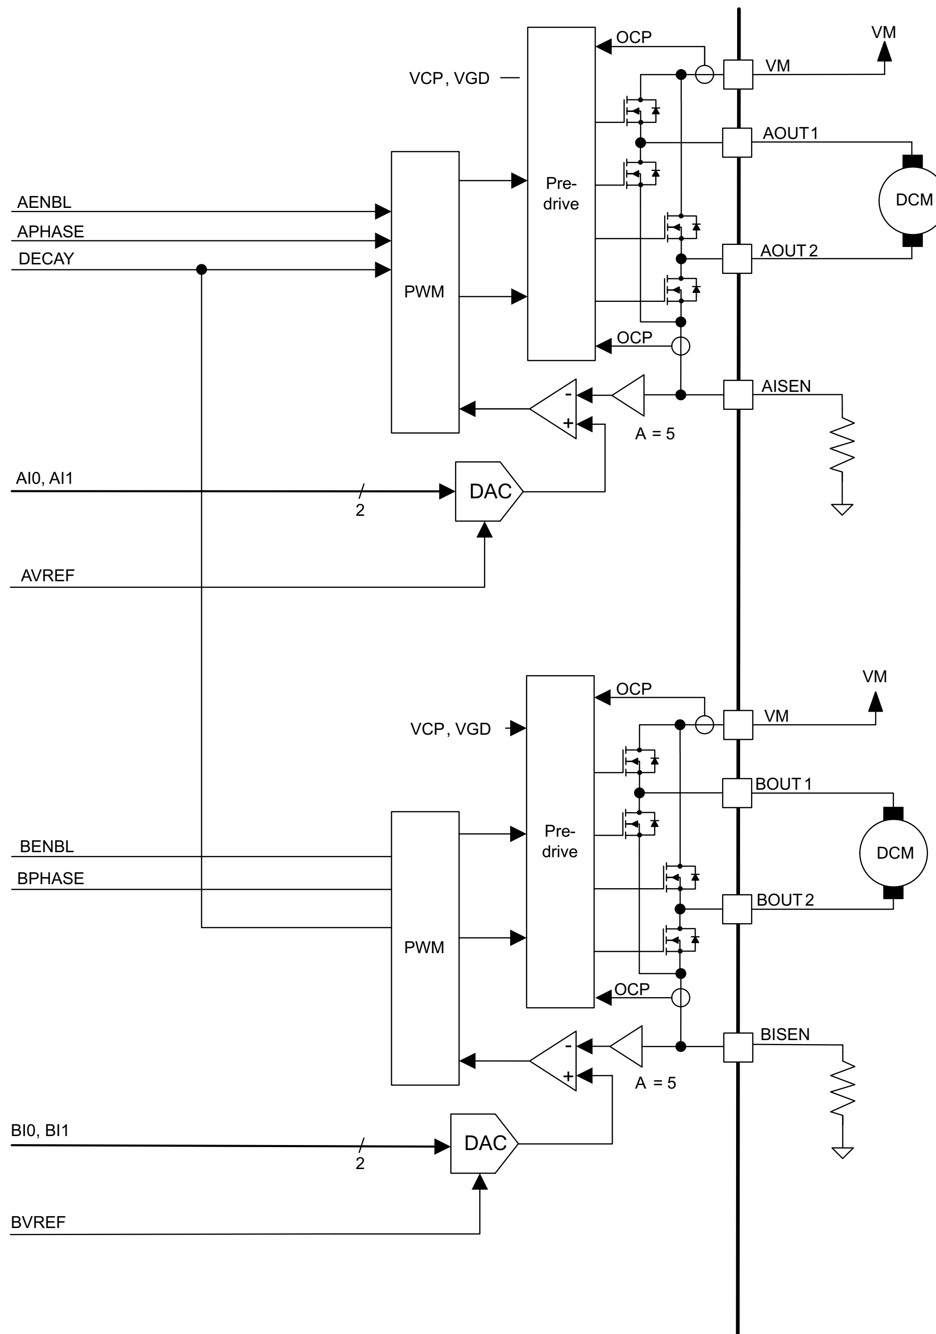

Figure 5. Motor Control Circuitry

Note that there are multiple VM pins (VMx). All VMx pins must be connected together to the motor supply voltage.

Copyright © 2014, Texas Instruments Incorporated

Feature Description (continued)

7.3.2 Bridge Control

The xPHASE input pins control the direction of current flow through each H-bridge, and therefore control the direction of rotation of a DC motor. The xENBL input pins enable the H-bridge outputs when active high, and can also be used for PWM speed control of the motor. Table 1 lists the H-bridge logic.

Table 1. H-Bridge Logic

xENBL	xPHASE	xOUT1	xOUT2
0	X	see [1]	see [1]
1	1	H	L
1	0	L	H

(1) Depends on state of the DECAY pin. See the *Decay Mode and Braking* section.

7.3.3 Current Regulation

The current through the motor windings is regulated by a fixed-frequency PWM current regulation, or current chopping. When an H-bridge is enabled, current rises through the winding at a rate dependent on the DC voltage and inductance of the winding. When the current hits the current chopping threshold, the bridge disables the current until the beginning of the next PWM cycle.

For stepping motors, current regulation is normally used at all times, and can change the current that is used to microstep the motor. For DC motors, current regulation is used to limit the start-up and stall current of the motor.

The PWM chopping current is set by a comparator that compares the voltage across a current sense resistor connected to the xISEN pins, multiplied by a factor of 5, with a reference voltage. The reference voltage is input from the xVREF pins, and is scaled by a 2-bit DAC that allows current settings of 38%, 71%, and 100% of full-scale, plus zero.

Use Equation 1 to calculate the full-scale (100%) chopping current.

$$I_{(CHOP)} = \frac{V_{(xVREF)}}{5 \times R_{(ISENx)}} \tag{1}$$

For example:

If a 0.5-Ω sense resistor is used and the voltage on the xVREF pin is 3.3 V, the full-scale (100%) chopping current is 3.3 V / (5 × 0.5 Ω) = 1.32 A.

Two input pins per H-bridge (xI1 and xI0) are used to scale the current in each bridge as a percentage of the full-scale current set by the xVREF input pin and sense resistance. Table 2 lists the function of the pins.

Table 2. H-Bridge Pin Functions

xI1	xI0	RELATIVE CURRENT (% FULL-SCALE CHOPPING CURRENT)
1	1	0% (Bridge disabled)
1	0	38%
0	1	71%
0	0	100%

Note that when both xI bits are 1, the H-bridge is disabled and no current flows.

For example:

If a 0.5-Ω sense resistor is used and the voltage on the xVREF pin is 3.3 V, the chopping current is 1.32 A at the 100% setting (xI1, xI0 = 00). At the 71% setting (xI1, xI0 = 01) the current is 1.32 A × 0.71 = 0.937 A. At the 38% setting (xI1, xI0 = 10) the current is 1.32 A × 0.38 = 0.502 A. If (xI1, xI0 = 11) the bridge is disabled and no current will flow.

Copyright © 2014, Texas Instruments Incorporated

7.3.4 Decay Mode and Braking

During PWM current chopping, the H-bridge is enabled to drive current through the motor winding until the PWM current chopping threshold is reached. See case 1 in Figure 6. The current-flow direction shown indicates the state when the xENBL pin is high.

When the chopping current threshold is reached, the H-bridge can operate in two different states, fast decay or slow decay.

In fast decay mode, when the PWM chopping current level has been reached, the H-bridge reverses state to allow winding current to flow in a reverse direction. As the winding current approaches zero, the bridge is disabled to prevent any reverse current flow. See case 2 in Figure 6 for fast decay mode.

In slow decay mode, winding current is re-circulated by enabling both of the low-side FETs in the bridge. See case 3 in Figure 6.

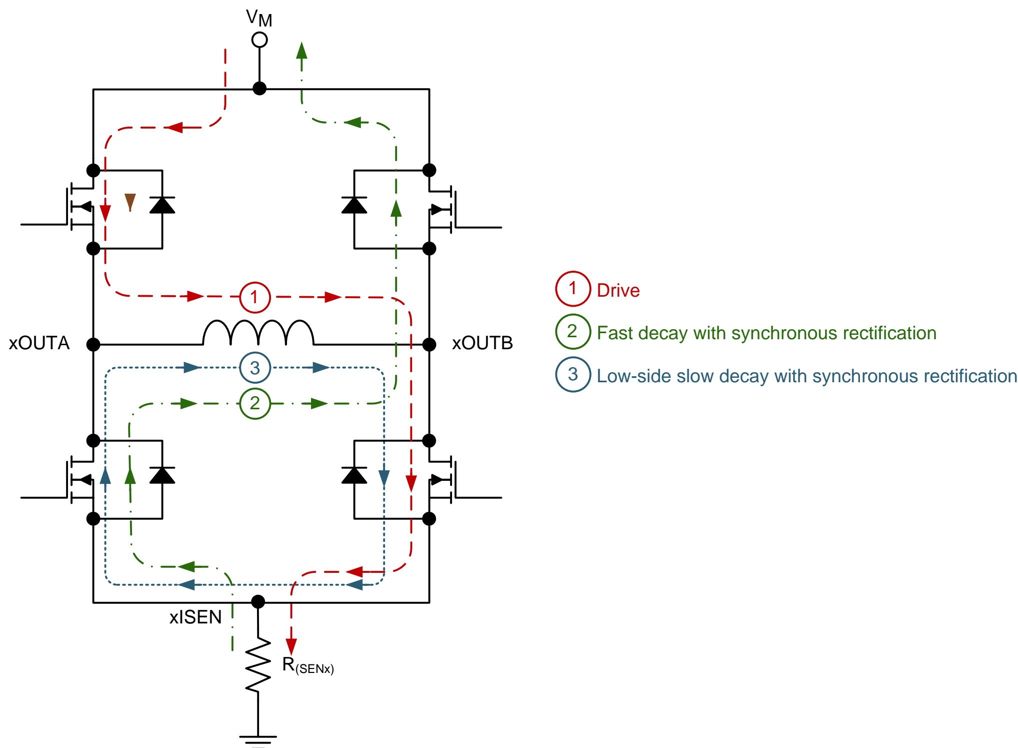

Figure 6. Decay Mode

The DRV8802-Q1 device supports fast decay and slow decay mode. Slow or fast decay mode is selected by the state of the DECAY pin. A logic low selects slow decay, and logic high sets fast decay mode. Note that the DECAY pin sets the decay mode for both H-bridges.

The DECAY mode also affects the operation of the bridge when it is disabled (by taking the ENBL pin inactive). This effect applies if the ENABLE input is being used for PWM speed control of the motor, or if it is simply being used to start and stop motor rotation.

If the DECAY pin is high (fast decay), when the bridge is disabled, all FETs are turned off and decay current flows through the body diodes, allowing the motor to coast to a stop.

If the DECAY pin is low (slow decay), both low-side FETs are turned on when the xENBL pin is made inactive. When the xENBL pin is made inactive, the inactivation essentially shorts out the back EMF of the motor, causing the motor to brake, and stop quickly. The low-side FETs stays in the ON state even after the current reaches zero.

7.3.5 Blanking Time

After the current is enabled in an H-bridge, the voltage on the xISEN pin is ignored for a fixed period of time before enabling the current sense circuitry. This blanking time is fixed at 3.75 μs. Note that the blanking time also sets the minimum on time of the PWM.

7.3.6 nRESET and nSLEEP Operation

The nRESET pin, when driven active low, resets the internal logic. This pin also disables the H-bridge drivers. All inputs are ignored while nRESET is active.

Driving nSLEEP low puts the device into a low power sleep state. In this state, the H-bridges are disabled, the gate drive charge pump is stopped, the V3P3OUT regulator is disabled, and all internal clocks are stopped. In this state all inputs are ignored until nSLEEP returns inactive high. When returning from sleep mode, some time (approximately 1 ms) must pass before the motor driver becomes fully operational.

7.3.7 Protection Circuits

The DRV8802-Q1 device is fully protected against undervoltage, overcurrent, and overtemperature events.

FAULT	ERROR REPORT	H-BRIDGE	CHARGE PUMP	RECOVERY
$V_{(VMx)}$ undervoltage (UVLO)	No error report – nFAULT is hi-Z	Disabled	Shut Down	$V_{(VMx)}$ > VUVLO RISING
Overcurrent (OCP)	nFAULT pulled low	Disabled	Operating	Retry time, $t_{(OCP)}$
Overtemperature Shutdown (OTS)	nFAULT remains pulled low (set during OTW)	Disabled	Shut Down	$T_J < T_{(OTS)} - T_{hys(OTS)}$

7.3.7.1 Overcurrent Protection (OCP)

An analog current-limit circuit on each FET limits the current through the FET by removing the gate drive. If this analog current-limit persists for longer than the OCP time, all FETs in the H-bridge are disabled and the nFAULT pin is driven low. The device remains disabled until either nRESET pin is applied, or $V_{(VMx)}$ is removed and re-applied.

Overcurrent conditions on both high-side and low-side devices (such as a short to ground, supply, or across the motor winding) result in an overcurrent shutdown. Note that overcurrent protection does not use the current sense circuitry used for PWM current control and is independent of the $R_{(ISENx)}$ resistor value or xVREF voltage.

7.3.7.2 Thermal Shutdown (TSD)

If the die temperature exceeds the thermal shutdown temperature limit, all FETs in the H-bridge are disabled and the nFAULT pin is driven low. When the die temperature has fallen below the temperature hsyteresis level, operation resumes automatically.

7.3.7.3 Undervoltage Lockout (UVLO)

If at any time the voltage on the VMx pins falls below the undervoltage lockout threshold voltage, all circuitry in the device is disabled and internal logic resets. Operation resumes when V_M rises above the UVLO threshold.

7.4 Device Functional Modes

The DRV8802-Q1 device is active unless the nSLEEP pin is brought logic low. In sleep mode the charge pump is disabled, the V3P3OUT regulator is disabled, and the H-bridge FETs are disabled hi-Z. The DRV8802-Q1 is brought out of sleep mode when nSLEEP is brought logic high.

8 Application and Implementation

8.1 Application Information

The DRV8802-Q1 device is used in medium voltage brushed-DC motor control applications.

8.2 Typical Application

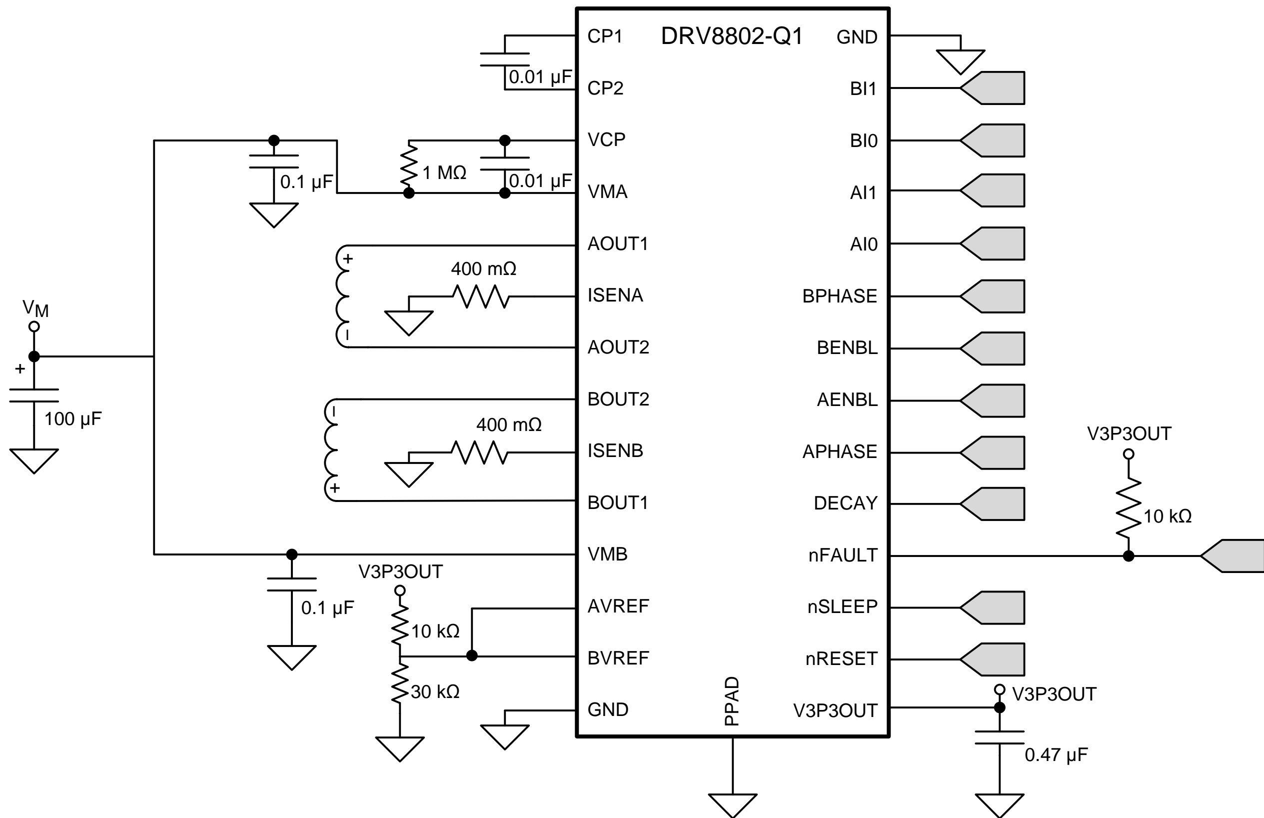

Figure 7. Typical Application Diagram

8.2.1 Design Requirements

The example supply for this design is $V_{(VMx)}$ = 18 V.

8.2.2 Detailed Design Procedure

8.2.2.1 Drive Current

The current path is through the high-side sourcing DMOS driver, motor winding, and low-side sinking DMOS power driver. Power dissipation I^2R losses in one source and sink DMOS driver are shown in Equation 2.

$$P_D = I^2(r_{DS(on)Source} + r_{DS(on)Sink}) \tag{2}$$

8.2.2.2 Slow-Decay SR (Brake Mode)

In slow-decay mode, both low-side sinking drivers turn on, allowing the current to circulate through the low side of the H-bridge (two sink drivers) and the load. Power dissipation I^2R loses in the two sink DMOS drivers as shown in Equation 3.

$$P_D = I^2(2 \times r_{DS(on)Sink}) \tag{3}$$

9 Power Supply Recommendations

The DRV8802-Q1 is designed to operate from an input voltage supply $V_{(VMx)}$ range between 8.2 and 45 V. Two 0.1-µF ceramic capacitors rated for $V_{(VMx)}$ must be placed as close as possible to the VMA and VMB pins respectively (one on each pin). In addition to the local decoupling caps, additional bulk capacitance is required and must be sized accordingly to the application requirements.

9.1 Bulk Capacitance

Bulk capacitance sizing is an important factor in motor drive system design. It is dependent on a variety of factors including:

- Type of power supply
- Acceptable supply voltage ripple
- Parasitic inductance in the power supply wiring
- Type of motor (Brushed DC, Brushless DC, Stepper)
- Motor startup current
- Motor braking method

The inductance between the power supply and motor drive system will limit the rate current can change from the power supply. If the local bulk capacitance is too small, the system will respond to excessive current demands or dumps from the motor with a change in voltage. You should size the bulk capacitance to meet acceptable voltage ripple levels. The datasheet generally provides a recommended value but system level testing is required to determine the appropriate sized bulk capacitor.

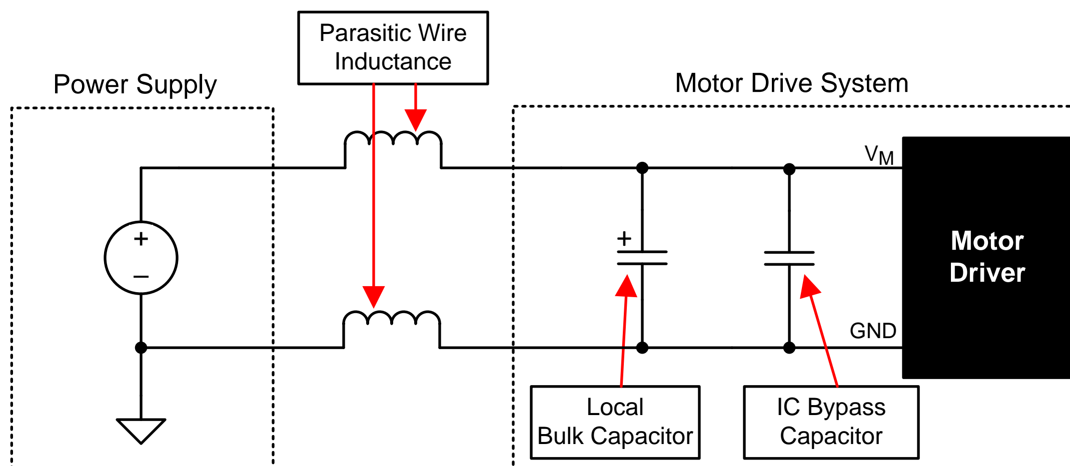

Figure 10. Example Setup of Motor Drive System WIth External Power Supply

9.2 Power Supply and Logic Sequencing

No specific sequence exists for powering-up the DRV8802-Q1 device. Digital input signals can be present before $V_{(VMx)}$ is applied. After $V_{(VMx)}$ is applied to the DRV8802-Q1 device, it begins operation based on the status of the control pins.

10 Layout

10.1 Layout Guidelines

The VMA and VMB pins should be bypassed to GND using low-ESR ceramic bypass capacitors with a recommended value of 0.1-µF rated for VM. This capacitor should be placed as close to the VMA and VMB pins as possible with a thick trace or ground plane connection to the device GND pin. The VMA and VMB pins must be bypassed to ground using an appropriate bulk capacitor. This component may be an electrolytic and should be located close to the DRV8802-Q1. A low-ESR ceramic capacitor must be placed in between the CPL and

Layout Guidelines (continued)

CPH pins. TI recommends a value of 0.01-μF rated for VM. Place this component as close to the pins as possible. A low-ESR ceramic capacitor must be placed in between the VMA and VCP pins. TI recommends a value of 0.1-μF rated for 16 V. Place this component as close to the pins as possible. Also, place a 1-MΩ resistor between VCP and VMA. Bypass V3P3 to ground with a ceramic capacitor rated 6.3 V. Place this bypass capacitor as close to the pin as possible.

10.2 Layout Example

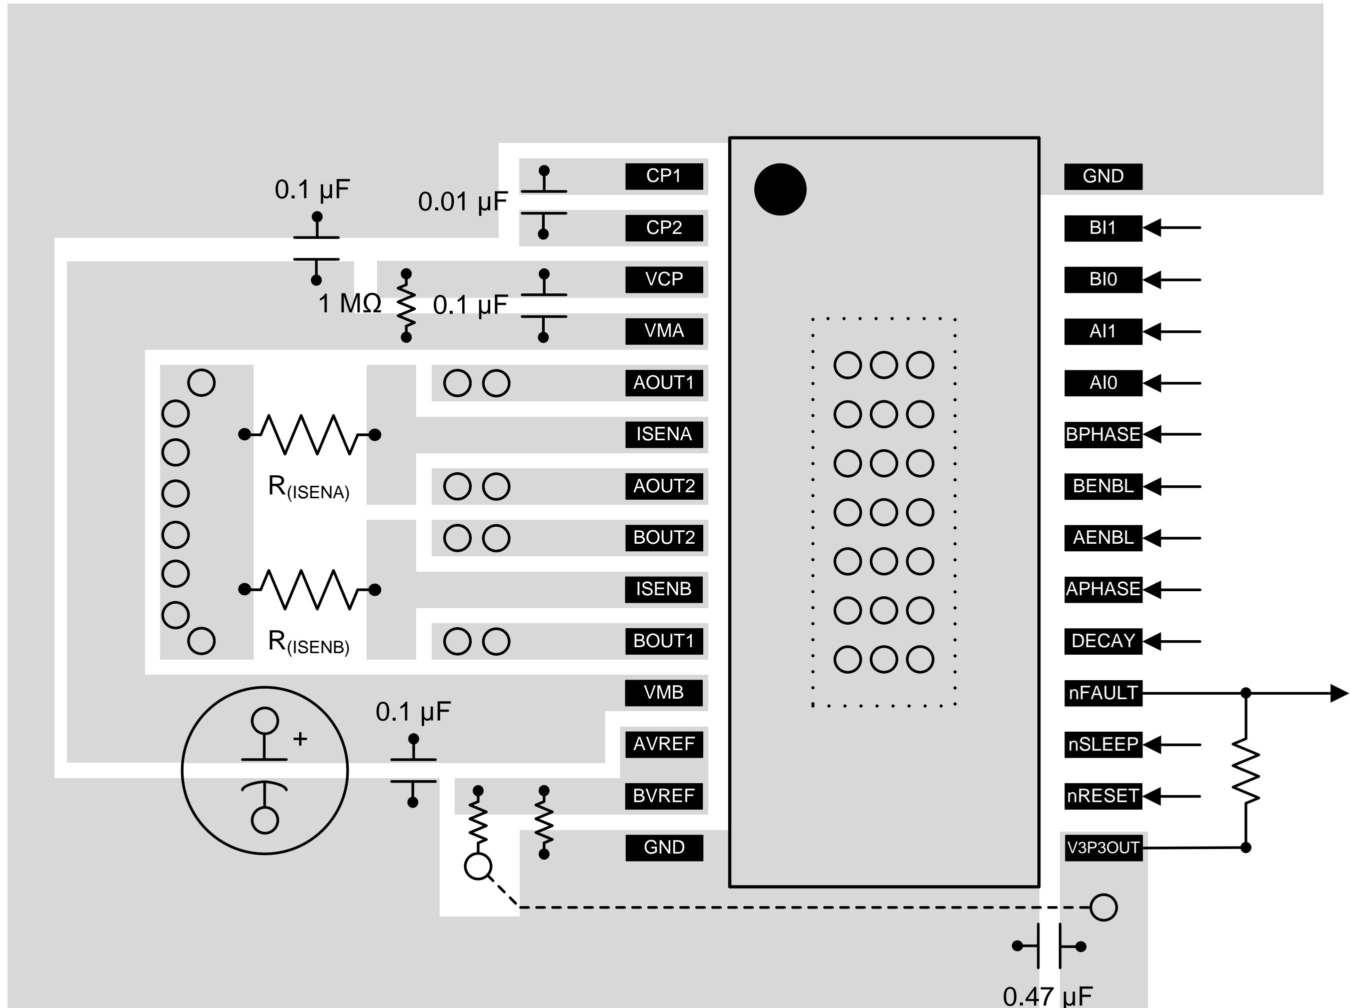

Figure 11. DRV8802-Q1 Layout Example

10.3 Thermal Information

10.3.1 Thermal Protection

The DRV8802-Q1 device has thermal shutdown (TSD) as described in the *Thermal Shutdown (TSD)* section. If the die temperature exceeds approximately 150°C, the device is disabled until the temperature drops below the hysteresis level.

Any tendency of the device to enter TSD is an indication of either excessive power dissipation, insufficient heatsinking, or too high an ambient temperature.

Copyright © 2014, Texas Instruments Incorporated

Thermal Information (continued)

10.3.2 Power Dissipation

Power dissipation in the DRV8802-Q1 device is dominated by the power dissipated in the output FET resistance, or $r_{DS(on)}$. Use Equation 4 to calculate the estimated average power dissipation of each H-bridge when running a DC motor.

$$P_D = 2 \times r_{DS(on)} \times I_O^2 \quad (4)$$

where

- P_D is the power dissipation of one H-bridge
- $r_{DS(on)}$ is the resistance of each FET
- I_O is the RMS output current being applied to each winding

I_O is equal to the average current drawn by the DC motor. Note that at startup and fault conditions this current is much higher than normal running current; these peak currents and the current duration must also be considered. The factor of 2 exists because at any instant two FETs are conducting winding current (one high-side and one low-side).

The total device dissipation is the power dissipated in each of the two H-bridges added together.

The maximum amount of power that can be dissipated in the device is dependent on ambient temperature and heatsinking.

NOTE

$r_{DS(on)}$ increases with temperature, so as the device heats, the power dissipation increases. This fact must be taken into consideration when sizing the heatsink.

10.3.3 Heatsinking

The PowerPAD package uses an exposed pad to remove heat from the device. For proper operation, this pad must be thermally connected to copper on the PCB to dissipate heat. On a multi-layer PCB with a ground plane, this connection can be accomplished by adding a number of vias to connect the thermal pad to the ground plane. On PCBs without internal planes, a copper area can be added on either side of the PCB to dissipate heat. If the copper area is on the opposite side of the PCB from the device, thermal vias are used to transfer the heat between top and bottom layers.

For details about how to design the PCB, refer to the TI application report, *PowerPAD™ Thermally Enhanced Package* (SLMA002), "" and the TI application brief, *PowerPAD Made Easy™* (SLMA004), available at www.ti.com.

In general, the more copper area that can be provided, the more power can be dissipated.

11 Device and Documentation Support

11.1 Trademarks

PowerPAD is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

11.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.3 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV8802QPWPRQ1	ACTIVE	HTSSOP	PWP	28	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV8802Q1	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PWP (R-PDSO-G28) PowerPAD™ SMALL PLASTIC OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

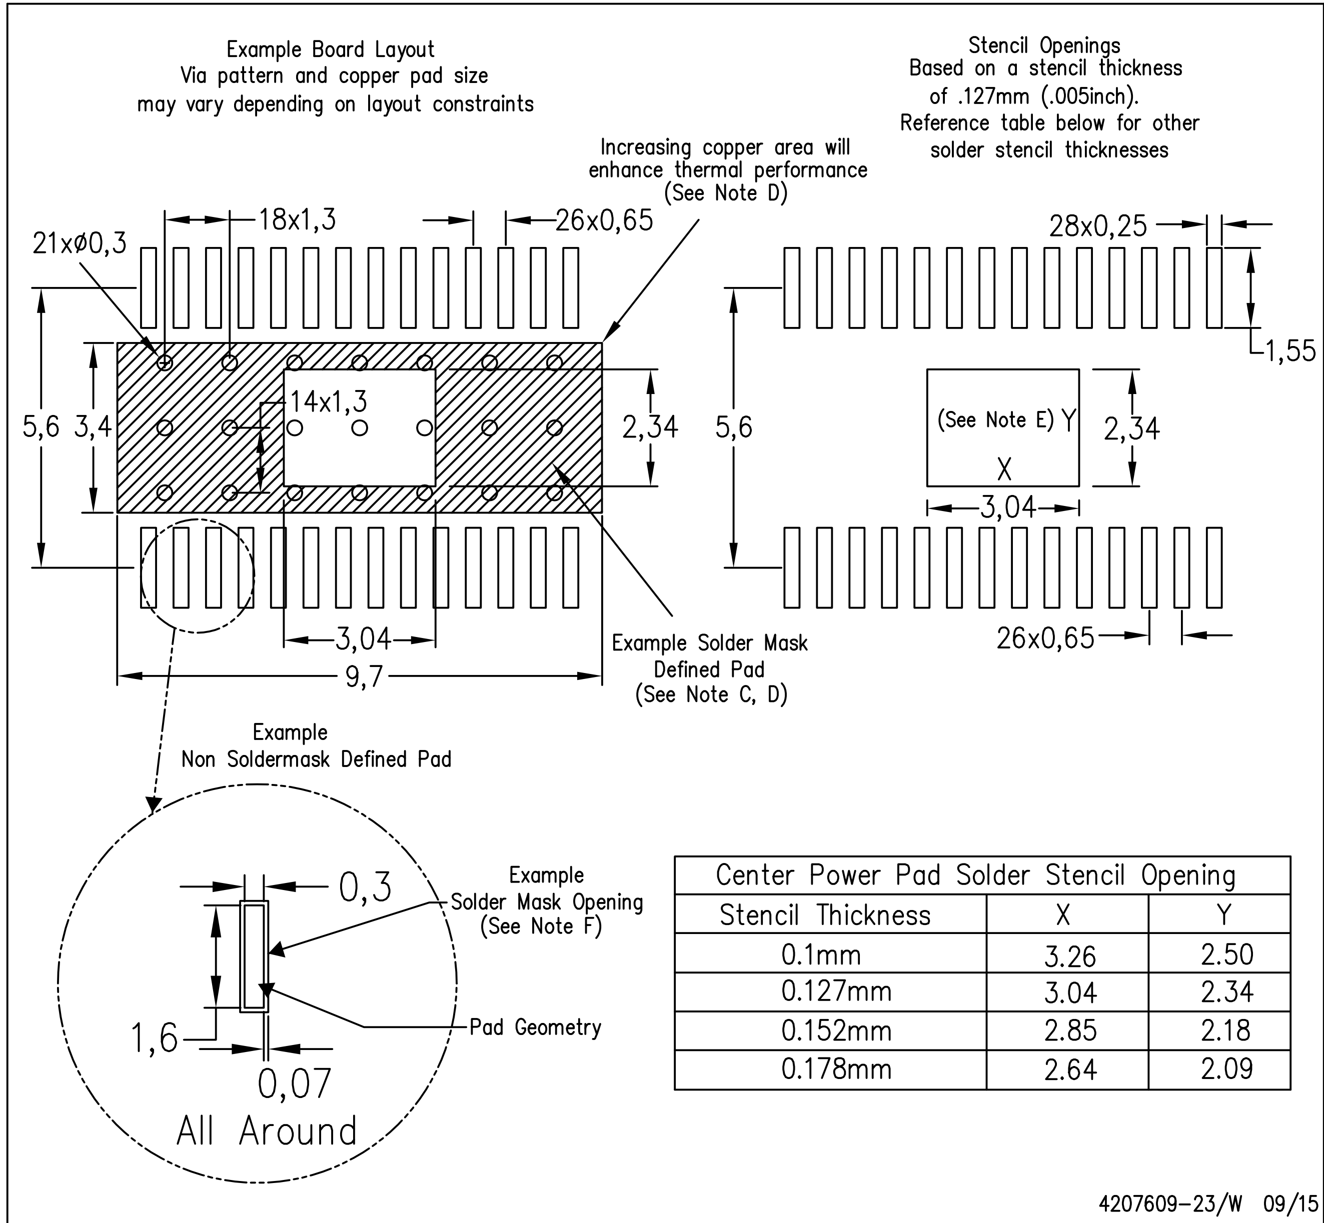
PWP (R–PDSO–G28) PowerPAD™ PLASTIC SMALL OUTLINE



Center Power Pad Solder Stencil Opening		
Stencil Thickness	X	Y
0.1mm	3.26	2.50
0.127mm	3.04	2.34
0.152mm	2.85	2.18
0.178mm	2.64	2.09

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>. Publication IPC–7351 is recommended for alternate designs.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC–7525 for other stencil recommendations.
F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
