

ONET8501PB 11.3-Gbps Rate-Selectable Limiting Amplifier

1 Features

- Up to 11.3-Gbps Operation
- 2-Wire Digital Interface
- Digitally Selectable Input Bandwidth
- Adjustable LOS Threshold
- Digitally Selectable Output Voltage
- Digitally Selectable Output Preemphasis
- Adjustable Input Threshold Voltage
- Low Power Consumption
- Input Offset Cancellation
- CML Data Outputs With On-Chip 50-Ω Back-Termination to VCC
- Single 3.3-V Supply
- Output Disable
- Surface Mount Small Footprint 3-mm × 3-mm, 16-Pin, RoHS compliant VQFN Package

2 Applications

- 10-Gigabit Ethernet Optical Receivers
- 2x, 4x, 8x, and 10x Fiber Channel Optical Receivers
- SONET OC-192/SDH-64 Optical Receivers
- SFP+ and XFP Transceiver Modules
- XENPAK, XPAK, X2, and 300-Pin MSA Transponder Modules
- Cable Drivers and Receivers

3 Description

The ONET8501PB device is a high-speed, 3.3-V limiting amplifier for multiple fiber optic and copper cable applications with data rates from 2 Gbps up to 11.3 Gbps.

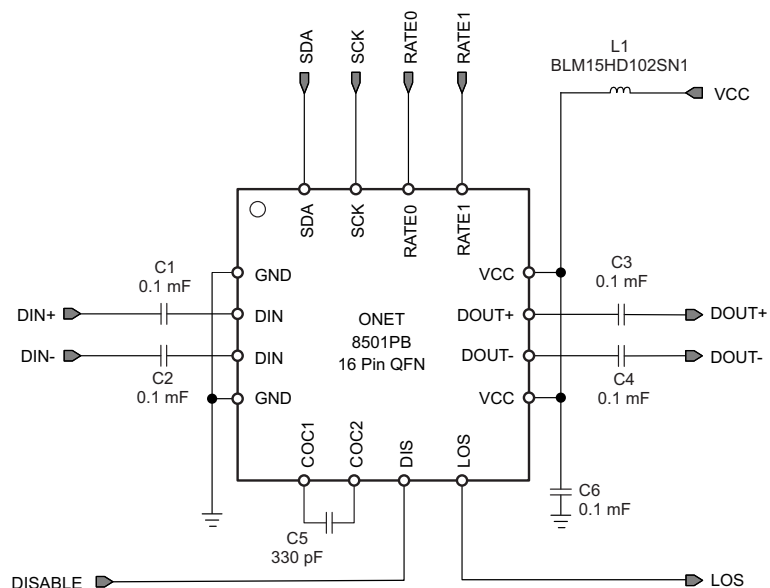

The device provides a two-wire serial interface which allows digital control of the bandwidth, output amplitude, output preemphasis, input threshold voltage (slice level), and the loss of signal assert level. Predetermined settings for bandwidth and LOS assert levels can also be selected with external rate selection pins.

5 Description (continued)

The ONET8501PB provides a gain of about 34 dB which ensures a fully differential output swing for input signals as low as 20 mV_{pp}. The output amplitude can be adjusted to 350 mV_{pp}, 650 mV_{pp}, or 850 mV_{pp}. To compensate for frequency-dependent loss of microstrips or striplines connected to the output of the device, programmable preemphasis is included in the output stage. A settable loss of signal detection and output disable are also provided.

The device, available in RoHS compliant small footprint 3-mm × 3-mm, 16-pin VQFN package, typically dissipates less than 170 mW and is characterized for operation from –40°C to 100°C.

6 Pin Configuration and Functions

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
COC1	5	Analog	Offset cancellation filter capacitor plus terminal. An external capacitor can be connected between this pin and COC2 to reduce the low frequency cutoff. To disable the offset cancellation loop, connect COC1 and COC2 together.
COC2	6	Analog	Offset cancellation filter capacitor minus terminal. An external capacitor can be connected between this pin and COC1 to reduce the low frequency cutoff. To disable the offset cancellation loop, connect COC1 and COC2 together.
DIN+	2	Analog-input	Noninverted data input. Differentially 100 Ω terminated to DIN–.
DIN–	3	Analog-input	Inverted data input. Differentially 100 Ω terminated to DIN+.
DIS	7	Digital-input	Disables the output stage when set to a high level.
DOUT–	10	CML-out	Inverted data output. On-chip 50 Ω back-terminated to VCC.
DOUT+	11	CML-out	Noninverted data output. On-chip 50 Ω back-terminated to VCC.
GND	1,4, EP	Supply	Circuit ground. Exposed die pad (EP) must be grounded.
LOS	8	Open-drain MOS	High level indicates that the input signal amplitude is below the programmed threshold level. Open-drain output. Requires an external 10-kΩ pullup resistor to VCC for proper operation.
RATE1	13	Digital-input	Bandwidth selection for noise suppression.
RATE0	14	Digital-input	Bandwidth selection for noise suppression.
SCK	15	Digital-input	Serial interface clock input. Connect a pullup resistor (10 kΩ typical) to VCC.
SDA	16	Digital-input	Serial interface data input. Connect a pullup resistor (10 kΩ typical) to VCC.
VCC	9, 12	Supply	3.3-V ± 10% supply voltage.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V_{CC}	Supply voltage ⁽²⁾	-0.3	4	V
V_{DIN+} , V_{DIN-}	Voltage at DIN+, DIN- ⁽²⁾	0.5	4	V
V_{LOS} , V_{COC1} , V_{COC2} , V_{DOUT+} , V_{DOUT-} , V_{DIS} , V_{RATE0} , V_{RATE1} , V_{SDA} , V_{SCK}	Voltage at LOS, COC1, COC2, DOUT+, DOUT-, DIS, RATE0, RATE1, SDA, SCK ⁽²⁾	-0.3	4	V
$V_{DIN,DIFF}$	Differential voltage between DIN+ and DIN-		±2.5	V
I_{DIN+} , I_{DIN-} , I_{DOUT+} , I_{DOUT-}	Continuous current at inputs and outputs		25	mA
T_{LEAD}	Lead temperature 1.6mm (1/16 inch) from case for 10 s		260	°C
T_A	Characterized free-air operating temperature	-40	100	°C
$T_{J,max}$	Maximum junction temperature		125	°C
T_{stg}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±750

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	2.95	3.3	3.6	V
T_A	Operating free-air temperature	-40		100	°C
	DIGITAL input high voltage	2			V
	DIGITAL input low voltage			0.8	V

7.4 DC Electrical Characteristics

Over recommended operating conditions, outputs connected to a 50-Ω load, AMP1 = 0, AMP0 = 1 (Register 3) unless otherwise noted. Typical operating condition is at $V_{CC} = 3.3$ V and $T_A = 25$ °C.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{CC}	Supply voltage	2.95	3.3	3.6	V
I_{VCC}	Supply current		50	63	mA
R_{IN}	Data input resistance		100		Ω
R_{OUT}	Data output resistance		50		Ω
	LOS HIGH voltage	$I_{SOURCE} = 50$ μA with 10-kΩ pullup to V_{CC}	2.4		V
	LOS LOW voltage	$I_{SINK} = 10$ mA with 10-kΩ pullup to V_{CC}		0.4	V

7.5 AC Electrical Characteristics

Over recommended operating conditions, outputs connected to a 50-Ω load, AMP1 = 0, AMP0 = 1 (Register 3) and maximum bandwidth unless otherwise noted. Typical operating condition is at $V_{CC} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$.

PARAMETER		TEST CONDITION	MIN	TYP	MAX	UNIT

8 Detailed Description

8.1 Overview

This compact, low-power, 11.3-Gbps limiting amplifier consists of a high-speed data path with offset cancellation block (DC feedback) combined with an analog settable input threshold adjust, a loss-of-signal detection block using two peak detectors, a two-wire interface with a control-logic block and a band-gap voltage reference and bias current generation block.

See [Functional Block Diagram](#) for a simplified block diagram of the ONET8501PB.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 High-Speed Data Path

The high-speed data signal is applied to the data path by means of input signal pins DIN+ / DIN–. The data path consists of a 100-Ω differential termination resistor followed by a digitally controlled bandwidth switch input buffer for rate select. The RATE1 and RATE0 pins can be used to control the bandwidth of the filter. Default bandwidth settings are used; however, these can be changed using registers 4 through 7 through the serial interface. For details regarding the rate selection, see [Table 19](#). A gain stage and an output buffer stage follow the input buffer, which together provide a gain of 34 dB. The device can accept input amplitude levels from 5 mV_{pp} up to 2000 mV_{pp}. The amplified data output signal is available at the output pins DOUT+ and DOUT, which includes on-chip 2 × 50-Ω back-termination to VCC.

Offset cancellation compensates for internal offset voltages and thus ensures proper operation even for very small input data signals. The offset cancellation can be disabled so that the input threshold voltage can be adjusted to optimize the bit error rate or change the eye crossing to compensate for input signal pulse width distortion. The offset cancellation can be disabled by setting OCDIS = 1 (bit 1 of register 0). The input threshold level can be adjusted using register settings THADJ[0..7] (register 1). For details regarding input threshold adjust, see [Table 19](#).

The low frequency cutoff is as low as 80 kHz with the built-in filter capacitor. For applications, which require even lower cutoff frequencies, an additional external filter capacitor may be connected to the COC1 and COC2 pins. A value of 330 pF results in a low frequency cutoff of 10 kHz.

8.3.2 Band-gap Voltage and Bias Generation

The ONET8501PB limiting amplifier is supplied by a single 3.3-V supply voltage connected to the VCC pins. This voltage is referred to ground (GND).

On-chip band-gap voltage circuitry generates a reference voltage, independent of supply voltage, from which all other internally required voltages and bias currents are derived.

8.4 Device Functional Modes

8.4.1 High-Speed Output Buffer

The output amplitude of the buffer can be set to 350 mV_{pp}, 650 mV_{pp}, or 850 mV_{pp} using register settings AMP[0..1] (register 3) through the serial interface. To compensate for frequency dependant losses of transmission lines connected to the output, the ONET8501PB has adjustable preemphasis of the output stage. The preemphasis can be set from 0 to 8 dB in 1-dB steps using register settings PEADJ[0..3] (register 2).

8.4.2 Rate Select

There are 16 possible internal filter settings (4 bit) to adjust the small signal bandwidth to the data rate. For fast rate selection, 4 default values can be selected with the RATE1 and RATE0 pins. Using the serial interface, the bandwidth settings can be customized instead of using the default values. The default bandwidths and the registers used to change the bandwidth settings are shown in [Table 1](#).

Table 1. Rate Selection Default Settings and Registers Used for Adjustment

RATE1	RATE0	DEFAULT BANDWIDTH (GHz)	REGISTER USED FOR ADJUSTMENT
0	0	2.4	RSA (Register 4)
0	1	7.6	RSB (Register 5)
1	1	8.4	RSC (Register 6)
1	0	9	RSD (Register 7)

If the rate select register selection bit is set LOW, for example RSASEL = 0 (bit 7 of register 4), then the default bandwidth for that register is used. If the register selection bit is set HIGH, for example RSASEL = 1 (bit 7 of register 4), then the content of RSA[0..3] (register 4) is used to set the input filter bandwidth when RATE0 = 0 and RATE1 = 0. The settings of the rate selection registers RSA, RSB, RSC, RSD, and the corresponding filter bandwidths are shown in [Table 2](#).

Table 2. Available Bandwidth Settings

RSX3	RSX2	RSX1	RSX0	TYPICAL BANDWIDTH (GHz)
0	0	0	0	9
0	0	0	1	8.6
0	0	1	0	8.4
0	0	1	1	8.1
0	1	0	0	7.9
0	1	0	1	7.6
0	1	1	0	6.9
0	1	1	1	6.2
1	0	0	0	5.2
1	0	0	1	4.2
1	0	1	0	3.7
1	0	1	1	3.4
1	1	0	0	3.2
1	1	0	1	2.8
1	1	1	0	2.6
1	1	1	1	2.4

The RATE1 and RATE0 pins do not have to be used if the serial interface is being used. If RATE1 is not connected it is internally pulled HIGH and if RATE0 is not connected it is internally pulled LOW, thus selecting register 7. Therefore, changing the contents of RSD[0..3] (register 7) through the serial interface can be used to adjust the bandwidth.

8.4.3 Loss-of-Signal Detection

The loss of signal detection is done by 2 separate level detectors to cover a wide dynamic range. The peak values of the input signal and the output signal of the gain stage are monitored by the peak detectors. The peak values are compared to a predefined loss of signal threshold voltage inside the loss of signal detection block. As a result of the comparison, the LOS signal, which indicates that the input signal amplitude is below the defined threshold level, is generated. The LOS assert level is settable through the serial interface. There are 2 LOS ranges settable with the LOSRNG bit (bit 2 register 0) through the serial interface. By setting the bit LOSRNG = 1, the high range of the LOS assert values are used (35 mV_{pp} to 80 mV_{pp}) and by setting the bit LOSRNG = 0, the low range of the LOS assert values are used (15 mV_{pp} to 35 mV_{pp}).

There are 128 possible internal LOS settings (7 bit) for each LOS range to adjust the LOS assert level. For fast LOS selection, 4 default values can be selected with the RATE1 and RATE0 pins; however, the LOS settings can be customized instead of using the default values. The default LOS assert levels and the registers used to change the LOS settings are shown in [Table 3](#).

Table 3. LOS Assert Level Default Settings and Registers Used for Adjustment

RATE1	RATE0	DEFAULT LOS ASSERT LEVEL (mV _{pp})	REGISTER USED FOR ADJUSTMENT
0	0	15	LOSA (Register 8)
0	1	18	LOSB (Register 9)
1	1	26	LOSC (Register 10)
1	0	26	LOSD (Register 11)

If the LOS register selection bit is set low, for example LOSASEL = 0 (bit 7 of register 8), then the default LOS assert level for that register is used. If the register selection bit is set high, for example LOSASEL = 1 (bit 7 of register 8), then the content of LOSA[0..6] (register 8) is used to set the LOS assert level when RATE1 = 0 and RATE0 = 0. The RATE1 and RATE0 pins do not have to be used if the serial interface is being used. If RATE1 is not connected it is internally pulled HIGH and if RATE0 is not connected it is internally pulled LOW, thus selecting register 11. Therefore, changing the content of LOSD[0..6] (register 11) through the serial interface can be used to adjust the LOS assert level.

8.5 Programming

8.5.1 2-Wire Interface and Control Logic

The ONET8501PB uses a 2-wire serial interface for digital control. The two circuit inputs, SDA and SCK, are driven, respectively, by the serial data and serial clock from a microcontroller, for example. Both inputs include 100-k Ω pullup resistors to VCC. For driving these inputs, TI recommends an open-drain output.

The 2-wire interface allows write access to the internal memory map to modify control registers and read access to read out control and status signals. The ONET8501PB is a slave device only which means that it can not initiate a transmission itself; it always relies on the availability of the SCK signal for the duration of the transmission. The master device provides the clock signal as well as the START and STOP commands. The protocol for a data transmission is as follows:

1. START command
2. 7-bit slave address (1000100) followed by an eighth bit which is the data direction bit (R/W). A zero indicates a WRITE and a 1 indicates a READ.
3. 8-bit register address
4. 8-bit register data word
5. STOP command

Regarding timing, the ONET8501PB is I²C compatible. The typical timing is shown in Figure 13 and a complete data transfer is shown in Figure 14. Parameters for Figure 13 are defined in Table 4.

Bus Idle: Both SDA and SCK lines remain HIGH

Start Data Transfer: A change in the state of the SDA line, from HIGH to LOW, while the SCK line is HIGH, defines a START condition (S). Each data transfer begins with a START condition.

Stop Data Transfer: A change in the state of the SDA line from LOW to HIGH while the SCK line is HIGH defines a STOP condition (P). Each data transfer ends with a STOP condition; however, if the master still wishes to communicate on the bus, it can generate a repeated START condition and address another slave without first generating a STOP condition.

Data Transfer: Only one data byte can be transferred between a START and a STOP condition. The receiver acknowledges the transfer of data.

Acknowledge: Each receiving device, when addressed, is obliged to generate an acknowledge bit. The transmitter releases the SDA line and a device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge clock pulse. Setup and hold times must be taken into account. When a slave-receiver doesn't acknowledge the slave address, the data line must be left HIGH by the slave. The master can then generate a STOP condition to abort the transfer. If the slave-receiver does acknowledge the slave address but some time later in the transfer cannot receive any more data bytes, the master must abort the transfer. This is indicated by the slave generating the not acknowledge on the first byte to follow. The slave leaves the data line HIGH and the master generates the STOP condition.

Figure 13. I²C Timing Diagram

Programming (continued)

Table 4. Timing Diagram Definitions

PARAMETER		MIN	MAX	UNIT
f_{SCK}	SCK clock frequency		400	kHz
t_{BUF}	Bus free time between START and STOP conditions	1.3		μ s
t_{HDSTA}	Hold time after repeated START condition. After this period, the first clock pulse is generated	0.6		μ s
t_{LOW}	Low period of the SCK clock	1.3		μ s
t_{HIGH}	High period of the SCK clock	0.6		μ s
t_{SUSTA}	Setup time for a repeated START condition	0.6		μ s
t_{HDDAT}	Data HOLD time	0		μ s
t_{SUDAT}	Data setup time	100		ns
t_R	Rise time of both SDA and SCK signals		300	ns
t_F	Fall time of both SDA and SCK signals		300	ns
t_{SUSTO}	Setup time for STOP condition	0.6		μ s

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

Figure 15 shows a typical application with digital control. In this case DIN+ and DIN- are connected to Transimpedance Amplifier (ROSA) and DOUT+ and DOUT- to SFP connector. SDA and SCK are connected to a microprocessor.

9.2 Typical Application

Figure 15 shows a typical application circuit using the ONET8501PB.

Figure 15. Typical Application Circuit

9.2.1 Design Requirements

For this design example, use the parameters listed in Table 20 as the input parameters.

Table 20. Design Parameters

PARAMETER	EXAMPLE VALUE
Supply voltage	3.3 V
V_{IN}	20 mV _{pp} to 2000 mV _{pp}
Data rate	8.5 Gbps to 10.3 Gbps
AC capacitors	0.1 μ F
COC capacitor	330 pF

9.2.2 Detailed Design Procedure

The purpose of the series resistors is to improve the signal integrity between the VCSEL driver and the VCSEL. Because the VCSEL impedance varies depending on its type, the series resistor provides a better matching impedance for the modulation current outputs.

The output amplitude adjustments are set as: AMP0 = 1 and AMP1 = 0 (see [Register 3](#)). DIN+, DIN-, DOUT+, and DOUT- are AC-coupled with 0.1 µF.

9.2.3 Application Curves

Figure 16. Output Eye-Diagram at 10.3 GBPS vs and Input Voltage (20 mV_{pp})

Figure 17. Output Eye-Diagram at 10.3 GBPS vs and Maximum Input Voltage (2000 mV_{pp})

Figure 18. Output Eye-Diagram at 8.5 GBPS and Input Voltage (20 mV_{pp})

Figure 19. Output Eye-Diagram at 8.5 GBPS and Maximum Input Voltage (2000 mV_{pp})

10 Power Supply Recommendations

The ONET8401PB is designed to operate with an input supply voltage range from 2.95 V to 3.6 V.

For SFP+ modules, the ONET8501PB must be used because of its low AC common-mode voltage.

The supply current of the ONET8501PB is dependent upon the output amplitude setting.

The typical setting for an SFP+ module is the 650-mV_{pp} output voltage. The typical supply current in this case is 50 mA leading to 165 mW.

11 Layout

11.1 Layout Guidelines

For optimum performance, use 50-Ω transmission lines (100-Ω differential) for connecting the high-speed inputs and outputs. The length of transmission lines must be kept as short as possible to reduce loss and pattern-dependent jitter. TI recommends maximizing the separation of the DOUT+ and DOUT– transmission lines from the DIN+ and DIN– transmission lines to minimize transmitter to receiver crosstalk.

11.2 Layout Example

Figure 20. ONET8501PB Layout Example

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Community Resource

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.3 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

 - Falls within JEDEC MO-220.

THERMAL PAD MECHANICAL DATA

RGT (S-PVQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4206349-7/Z 08/15

NOTE: All linear dimensions are in millimeters

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
