

ISO5451 High-CMTI 2.5-A and 5-A Isolated IGBT, MOSFET Gate Driver With Active Protection Features

1 Features

- 50-kV/ μ s Minimum and 100-kV/ μ s Typical Common-Mode Transient Immunity (CMTI) at $V_{CM} = 1500$ V
- 2.5-A Peak Source and 5-A Peak Sink Currents
- Short Propagation Delay: 76 ns (Typ), 110 ns (Max)
- 2-A Active Miller Clamp
- Output Short-Circuit Clamp
- Fault Alarm upon Desaturation Detection is Signaled on \overline{FLT} and Reset Through \overline{RST}
- Input and Output Under Voltage Lock-Out (UVLO) with Ready (RDY) Pin Indication
- Active Output Pull-down and Default Low Outputs with Low Supply or Floating Inputs
- 3-V to 5.5-V Input Supply Voltage
- 15-V to 30-V Output Driver Supply Voltage
- CMOS Compatible Inputs
- Rejects Input Pulses and Noise Transients Shorter Than 20 ns
- Operating Temperature: -40°C to $+125^{\circ}\text{C}$ Ambient
- Isolation Surge Withstand Voltage $10000\text{-}V_{PK}$
- Safety-Related Certifications:
 - $8000\text{-}V_{PK}$ V_{IOTM} and $1420\text{-}V_{PK}$ V_{IORM} Reinforced Isolation per DIN V VDE V 0884-10 (VDE V 0884-10):2006-12
 - $5700\text{-}V_{RMS}$ Isolation for 1 Minute per UL 1577
 - CSA Component Acceptance Notice 5A, IEC 60950–1 and IEC 60601–1 End Equipment Standards
 - TUV Certification per EN 61010-1 and EN 60950-1
 - GB4943.1-2011 CQC Certification

2 Applications

- Isolated IGBT and MOSFET Drives in:
 - Industrial Motor Control Drives
 - Industrial Power Supplies
 - Solar Inverters
 - HEV and EV Power Modules
 - Induction Heating

3 Description

The ISO5451 is a $5.7\text{-}kV_{RMS}$, reinforced isolated gate driver for IGBTs and MOSFETs with 2.5-A source and 5-A sink current. The input side operates from a single 3-V to 5.5-V supply. The output side allows for a supply range from minimum 15 V to maximum 30 V. Two complementary CMOS inputs control the output state of the gate driver. The short propagation time of 76 ns assures accurate control of the output stage.

An internal desaturation (DESAT) fault detection recognizes when the IGBT is in an overload condition. Upon a DESAT detect, the gate driver output is driven low to V_{EE2} potential, turning the IGBT immediately off.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
ISO5451	SOIC (16)	10.30 mm x 7.50 mm

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (December 2015) to Revision C	Page
• Changed the title of the data sheet from <i>Active Safety Features</i> to <i>Active Protection Features</i>	1
• Changed <i>Safety and Regulatory Certifications</i> From: CSA Component Acceptance Notice 5A, IEC 60950–1 and IEC 60601–1 and IEC 61010-1 End Equipment Standards To: CSA Component Acceptance Notice 5A, IEC 60950–1 and IEC 60601–1 End Equipment Standards	1
• Changed <i>Safety and Regulatory Certifications</i> From: CQC Certification per GB4943.1-2011 To: GB4943.1-2011 CQC Certification	1
• Changed <i>Safety and Regulatory Certifications</i> From: All Certifications are Planned To: All Certifications Complete per UL, VDE, CQC, TUV and Planned for CSA	1
• Changed the CSA status from planned to certified	8
• Changed the certifications in the <i>Safety-Related Certifications</i> table	8
• Added <i>Reinforced High-Voltage Capacitor Life Time Projection</i> to <i>Safety and Insulation Characteristics Curves</i>	11
• Changed the second paragraph of <i>Typical Applications</i>	23
• Added text "and RST input signal" to the <i>Design Requirements</i>	24
• Changed the <i>PCB Material</i> section	31
• Added the <i>Receiving Notification of Documentation Updates</i> section	32
• Changed the <i>Electrostatic Discharge Caution</i> section	32

Changes from Revision A (June 2015) to Revision B	Page
• Changed <i>Features, Safety and Regulatory Approvals</i> From: 6000 V _{PK} To: 8000 V _{PK}	1
• Changed <i>Features, Safety and Regulatory Approvals</i> From: 4250 V _{RMS} To: 5700 V _{RMS}	1
• Added the <i>Power Rating</i> table	6
• Moved <i>Insulation Characteristics</i> to the <i>Specifications</i> section	7

• Changed the Test Conditions and values for q_{pd} in <i>Insulation Characteristics</i>	7
• Changed R_{IO} Test conditions From: $100^{\circ}\text{C} \leq T_A \leq \text{max To: } 100^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ in <i>Insulation Characteristics</i>	7
• Changed R_{IO} Test conditions From: T_S To: $T_S = 150^{\circ}\text{C}$ in <i>Insulation Characteristics</i>	7
• Changed the <i>Safety-Related Certifications</i> table.....	8
• Moved <i>Safety-Related Certifications</i> to the <i>Specifications</i> section	8
• Moved <i>Safety Limiting Values</i> to the <i>Specification</i> section	8
• Added Note 1 to I_{IH} in the <i>Electrical Characteristics</i> table	9
• Added Note 2 to I_{IL} in the <i>Electrical Characteristics</i> table	9
• Changed <i>Thermal Derating Curve for Safety Limiting Current per VDE</i> and Added <i>Thermal Derating Curve for Safety Limiting Power per VDE</i>	11
• Added I_{CC1} <i>Supply Current vs Temperature</i> to <i>Blanking Capacitor Charging Current vs Temperature</i>	13
• Added text ", but connecting CLAMP output of the gate driver to the IGBT gate is also not an issue." to <i>Supply and Active Miller Clamp</i>	21
• Deleted ground symbol on pin 11 of <i>Global Shutdown with Inverting Input Configuration</i>	27
• Deleted ground symbol on pin 11 on the inverting input of <i>Auto Reset for Non-inverting and Inverting Input Configuration</i>	27
• Changed <i>Normal Operation - Bipolar Supply</i> and <i>Normal Operation - Unipolar Supply</i>	30

Changes from Original (June 2015) to Revision A
Page

• Changed from a 1-page Product Preview to the full datasheet.	1
• Changed <i>Features, Safety and Regulatory Approvals</i> From: $8000 V_{PK} V_{IOTM}$ and $2121 V_{PK}$ To: $6000 V_{PK} V_{IOTM}$ and $1420 V_{PK}$	1
• Changed <i>Features, Safety and Regulatory Approvals</i> From: $5.7 kV_{RMS}$ To: $4250 V_{RMS}$	1
• Changed the <i>Applications</i> list	1
• Moved <i>Safety and Insulation Characteristics Curves</i> to the <i>Specifications</i>	11

5 Description (continued)

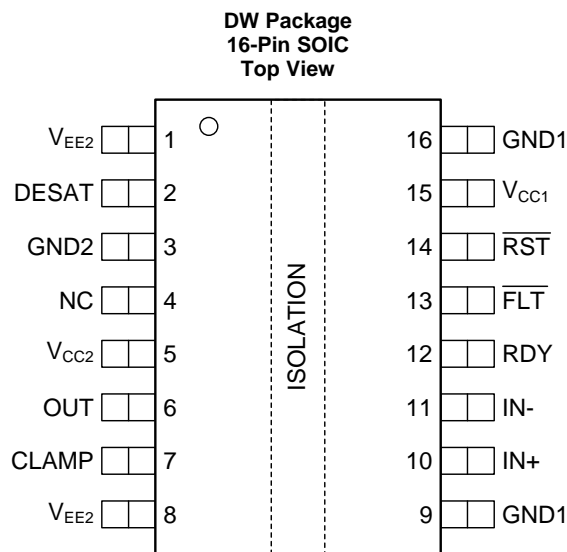

When desaturation is active, a fault signal is sent across the isolation barrier, pulling the $\overline{\text{FLT}}$ output at the input side low and blocking the isolator input. The $\overline{\text{FLT}}$ output condition is latched and can be reset through a low-active pulse at the $\overline{\text{RST}}$ input.

When the IGBT is turned off during normal operation with bipolar output supply, the output is hard clamp to $V_{\text{EE}2}$. If the output supply is unipolar, an active Miller clamp can be used, allowing Miller current to sink across a low impedance path, preventing IGBT to be dynamically turned on during high voltage transient conditions.

The readiness for the gate driver to be operated is under the control of two undervoltage-lockout circuits monitoring the input side and output side supplies. If either side has insufficient supply the RDY output goes low, otherwise this output is high.

The ISO5451 is available in a 16-pin SOIC package. Device operation is specified over a temperature range from -40°C to $+125^{\circ}\text{C}$ ambient.

6 Pin Configuration and Function

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
CLAMP	7	O	Miller clamp output
DESAT	2	I	Desaturation voltage input
$\overline{\text{FLT}}$	13	O	Fault output, low-active during DESAT condition
GND1	9, 16	—	Input ground
GND2	3	—	Gate drive common. Connect to IGBT emitter
IN+	10	I	Non-inverting gate drive voltage control input
IN-	11	I	Inverting gate drive voltage control input
NC	4	—	Not connected
OUT	6	O	Gate drive voltage output
RDY	12	O	Power-good output, active high when both supplies are good
$\overline{\text{RST}}$	14	I	Reset input, apply a low pulse to reset fault latch
$V_{\text{CC}1}$	15	—	Positive input supply (3 V to 5.5 V)
$V_{\text{CC}2}$	5	—	Most positive output supply potential
$V_{\text{EE}2}$	1, 8	—	Output negative supply. Connect to GND2 for unipolar-supply application

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{CC1}	Supply voltage input side	GND1 – 0.3	6	V
V _{CC2}	Positive supply voltage output side	(V _{CC2} – GND2)	35	V
V _{EE2}	Negative supply voltage output side	(V _{EE2} – GND2)	0.3	V
V _(SUP2)	Total supply output voltage	(V _{CC2} – V _{EE2})	35	V
V _{OUT}	Gate driver output voltage	V _{EE2} – 0.3	V _{CC2} + 0.3	V
I _(OUTH)	Gate driver high output current	Gate driver high output current (max pulse width = 10 μs, max duty cycle = 0.2%)		2.7
I _(OUTL)	Gate driver low output current	Gate driver high output current (max pulse width = 10 μs, max duty cycle = 0.2%)		5.5
V _(LIP)	Voltage at IN+, IN–, $\overline{\text{FLT}}$, RDY, $\overline{\text{RST}}$	GND1 – 0.3	V _{CC1} + 0.3	V
I _(LOP)	Output current of $\overline{\text{FLT}}$, RDY			10
V _(DESAT)	Voltage at DESAT	GND2 – 0.3	V _{CC2} + 0.3	V
V _(CLAMP)	Clamp voltage	V _{EE2} – 0.3	V _{CC2} + 0.3	V
T _J	Junction temperature	–40	150	°C
T _{STG}	Storage temperature	–65	150	°C

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{CC1}	Supply voltage input side	3		5.5	V
V _{CC2}	Positive supply voltage output side (V _{CC2} – GND2)	15		30	V
V _{EE2}	Negative supply voltage output side (V _{EE2} – GND2)	–15		0	V
V _(SUP2)	Total supply voltage output side (V _{CC2} – V _{EE2})	15		30	V
V _{IH}	High-level input voltage (IN+, IN–, $\overline{\text{RST}}$)	0.7 × V _{CC1}		V _{CC1}	V
V _{IL}	Low-level input voltage (IN+, IN–, $\overline{\text{RST}}$)	0	0.3 × V _{CC1}		V
t _{UI}	Pulse width at IN+, IN– for full output (C _{LOAD} = 1 nF)	40			ns
t _{RST}	Pulse width at $\overline{\text{RST}}$ for resetting fault latch	800			ns
T _A	Ambient temperature	–40	25	125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ISO5451	
		DW (SOIC)	UNIT
		16 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	99.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	48.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	56.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	29.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	56.5	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Power Ratings

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P_D	Maximum power dissipation ⁽¹⁾				1255	mW
P_{ID}	Maximum input power dissipation				175	mW
P_{OD}	Maximum output power dissipation				1080	mW

(1) Full chip power dissipation is de-rated 10.04 mW/°C beyond 25°C ambient temperature. At 125°C ambient temperature, a maximum of 251 mW total power dissipation is allowed. Power dissipation can be optimized depending on ambient temperature and board design, while ensuring that Junction temperature does not exceed 150°C.

7.6 Insulation Characteristics

PARAMETER		TEST CONDITIONS	SPECIFICATION	UNIT
CLR	External clearance ⁽¹⁾	Shortest terminal-to-terminal distance through air	>8	mm
CPG	External creepage ⁽¹⁾	Shortest terminal-to-terminal distance across the package surface	>8	mm
DTI	Distance through the insulation	Minimum internal gap (internal clearance)	>21	μm
CTI	Tracking resistance (comparative tracking index)	DIN EN 60112 (VDE 0303-11); IEC 60112; UL 746A	>600	V
	Material Group	According to IEC 60664-1	I	
	Overvoltage category (according to IEC 60664-1)	Rated Mains Voltage ≤ 300 V _{RMS}	I-IV	
		Rated Mains Voltage ≤ 600 V _{RMS}	I-III	
		Rated Mains Voltage ≤ 1000 V _{RMS}	I-II	
DIN V VDE V 0884-10 (VDE V 0884-10):2006-12⁽²⁾				
V _{IORM}	Maximum repetitive peak isolation voltage	AC voltage (bipolar)	1420	V _{PK}
V _{IOWM}	Maximum isolation working voltage	AC voltage. Time dependent dielectric breakdown (TDDb) Test, see Figure 1	1000	V _{RMS}
		DC voltage	1420	V _{DC}
V _{IOTM}	Maximum Transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60 sec (qualification), t = 1 sec (100% production)	8000	V _{PK}
V _{IOSM}	Maximum surge isolation voltage ⁽³⁾	Test method per IEC 60065, 1.2/50 μs waveform, V _{TEST} = 1.6 × V _{IOSM} = 10000 V _{PK} (qualification) ⁽³⁾	6250	
q _{pd}	Apparent charge ⁽⁴⁾	Method a: After I/O safety test subgroup 2/3, V _{ini} = V _{IOTM} , t _{ini} = 60 s; V _{pd(m)} = 1.2 × V _{IORM} = 1704 V _{PK} , t _m = 10 s	≤5	pC
		Method a: After environmental tests subgroup 1, V _{ini} = V _{IOTM} , t _{ini} = 60 s; V _{pd(m)} = 1.6 × V _{IORM} = 2272 V _{PK} , t _m = 10 s	≤5	
		Method b1: At routine test (100% production) and preconditioning (type test) V _{ini} = V _{IOTM} , t _{ini} = 60 s; V _{pd(m)} = 1.875 × V _{IORM} = 2663 V _{PK} , t _m = 10 s	≤5	
R _{IO}	Isolation resistance, input to output ⁽⁵⁾	V _{IO} = 500 V, T _A = 25°C	> 10 ¹²	Ω
		V _{IO} = 500 V, 100°C ≤ T _A ≤ 125°C	> 10 ¹¹	Ω
		V _{IO} = 500 V at T _S = 150°C	> 10 ⁹	Ω
C _{IO}	Barrier capacitance, input to output ⁽⁵⁾	V _{IO} = 0.4 × sin(2πft), f = 1 MHz	~1	pF
	Pollution degree		2	
	Climatic category		40/125/21	
UL 1577				
V _{ISO}	Withstanding Isolation voltage	V _{TEST} = V _{ISO} , t = 60 sec (qualification), V _{TEST} = 1.2 × V _{ISO} = 6840 V _{RMS} , t = 1 sec (100% production)	5700	V _{RMS}

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
- (2) This coupler is suitable for basic electrical insulation only within the maximum operating ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier tied together creating a two-terminal device

7.7 Safety-Related Certifications

VDE	CSA	UL	CQC	TUV
Certified according to DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 and DIN EN 60950-1 (VDE 0805 Teil 1):2011-01	Certified according to CSA Component Acceptance Notice 5A, IEC 60950-1 and IEC 60601-1	Certified according to UL 1577 Component Recognition Program	Certified according to GB 4943.1-2011	Certified according to EN 61010-1:2010 (3rd Ed) and EN 60950-1:2006/A11:2009/A1:2010 / A12:2011/A2:2013

7.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_S Safety input, output or supply current	$R_{\theta JA} = 99.6^\circ\text{C/W}$, $V_I = 3.6\text{ V}$, $T_J = 150^\circ\text{C}$, $T_A = 25^\circ\text{C}$			349	mA
	$R_{\theta JA} = 99.6^\circ\text{C/W}$, $V_I = 5.5\text{ V}$, $T_J = 150^\circ\text{C}$, $T_A = 25^\circ\text{C}$			228	
	$R_{\theta JA} = 99.6^\circ\text{C/W}$, $V_I = 15\text{ V}$, $T_J = 150^\circ\text{C}$, $T_A = 25^\circ\text{C}$			84	
	$R_{\theta JA} = 99.6^\circ\text{C/W}$, $V_I = 30\text{ V}$, $T_J = 150^\circ\text{C}$, $T_A = 25^\circ\text{C}$			42	
P_S Safety input, output, or total power	$R_{\theta JA} = 99.6^\circ\text{C/W}$, $T_J = 150^\circ\text{C}$, $T_A = 25^\circ\text{C}$			1255 ⁽¹⁾	mW
T_S Maximum ambient safety temperature				150	$^\circ\text{C}$

(1) Input, output, or the sum of input and output power should not exceed this value

The safety-limiting constraint is the maximum junction temperature specified in the data sheet. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

7.9 Electrical Characteristics

Over recommended operating conditions unless otherwise noted. All typical values are at $T_A = 25^\circ\text{C}$, $V_{CC1} = 5\text{ V}$, $V_{CC2} - \text{GND2} = 15\text{ V}$, $\text{GND2} - V_{EE2} = 8\text{ V}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
VOLTAGE SUPPLY						
$V_{IT+}(UVLO1)$	Positive-going UVLO1 threshold voltage input side ($V_{CC1} - \text{GND1}$)				2.25	V
$V_{IT-}(UVLO1)$	Negative-going UVLO1 threshold voltage input side ($V_{CC1} - \text{GND1}$)		1.7			V
$V_{HYS}(UVLO1)$	UVLO1 Hysteresis voltage ($V_{IT+} - V_{IT-}$) input side			0.24		V

9 Detailed Description

9.1 Overview

The ISO5451 is an isolated gate driver for IGBTs and MOSFETs. Input CMOS logic and output power stage are separated by a capacitive, silicon dioxide (SiO_2), isolation barrier.

The IO circuitry on the input side interfaces with a micro controller and consists of gate drive control and RESET ($\overline{\text{RST}}$) inputs, READY (RDY) and FAULT ($\overline{\text{FLT}}$) alarm outputs. The power stage consists of power transistors to supply 2.5-A pullup and 5-A pulldown currents to drive the capacitive load of the external power transistors, as well as DESAT detection circuitry to monitor IGBT collector-emitter overvoltage under short circuit events. The capacitive isolation core consists of transmit circuitry to couple signals across the capacitive isolation barrier, and receive circuitry to convert the resulting low-swing signals into CMOS levels. The ISO5451 also contains undervoltage lockout circuitry to prevent insufficient gate drive to the external IGBT, and active output pulldown feature which ensures that the gate-driver output is held low, if the output supply voltage is absent. The ISO5451 also has an active Miller clamp function which can be used to prevent parasitic turnon of the external power transistor, because of Miller effect, for unipolar supply operation.

9.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

9.3 Feature Description

9.3.1 Supply and Active Miller Clamp

The ISO5451 supports both bipolar and unipolar power supply with active Miller clamp.

For operation with bipolar supplies, the IGBT is turned off with a negative voltage on its gate with respect to its emitter. This prevents the IGBT from unintentionally turning on because of current induced from its collector to its gate due to Miller effect. In this condition it is not necessary to connect CLAMP output of the gate driver to the IGBT gate, but connecting CLAMP output of the gate driver to the IGBT gate is also not an issue. Typical values of V_{CC2} and V_{EE2} for bipolar operation are 15 V and -8 V with respect to GND2.

For operation with unipolar supply, typically, V_{CC2} is connected to 15 V with respect to GND2, and V_{EE2} is connected to GND2. In this use case, the IGBT can turn-on due to additional charge from IGBT Miller capacitance caused by a high voltage slew rate transition on the IGBT collector. To prevent IGBT to turn on, the CLAMP pin is connected to IGBT gate and Miller current is sunk through a low impedance CLAMP transistor.

Miller CLAMP is designed for miller current up to 2 A. When the IGBT is turned-off and the gate voltage transitions below 2 V the CLAMP current output is activated.

9.3.2 Active Output Pull-down

The Active output pulldown feature ensures that the IGBT gate OUT is clamped to V_{EE2} to ensure safe IGBT off-state when the output side is not connected to the power supply.

9.3.3 Undervoltage Lockout (UVLO) with Ready (RDY) Pin Indication Output

Undervoltage Lockout (UVLO) ensures correct switching of IGBT. The IGBT is turned-off, if the supply V_{CC1} drops below $V_{IT-(UVLO1)}$, irrespective of IN+, IN– and RST input till V_{CC1} goes above $V_{IT+(UVLO1)}$.

In similar manner, the IGBT is turned-off, if the supply V_{CC2} drops below $V_{IT-(UVLO2)}$, irrespective of IN+, IN– and RST input till V_{CC2} goes above $V_{IT+(UVLO2)}$.

Ready (RDY) pin indicates status of input and output side Under Voltage Lock-Out (UVLO) internal protection feature. If either side of device have insufficient supply (V_{CC1} or V_{CC2}), the RDY pin output goes low; otherwise, RDY pin also serves as an indication to the micro-controller that the device is ready for operation.

9.3.4 Fault (\overline{FLT}) and Reset (\overline{RST})

During IGBT overload condition, to report desaturation error \overline{FLT} goes low. If \overline{RST} is held low for the specified duration, \overline{FLT} is cleared at rising edge of \overline{RST} . \overline{RST} has an internal filter to reject noise and glitches. By asserting \overline{RST} for at-least the specified minimum duration, device input logic can be enabled or disabled.

9.3.5 Short Circuit Clamp

Under short circuit events it is possible that currents are induced back into the gate-driver OUT and CLAMP pins due to parasitic Miller capacitance between the IGBT collector and gate terminals. Internal protection diodes on OUT and CLAMP help to sink these currents while clamping the voltages on these pins to values slightly higher than the output side supply.

9.4 Device Functional Modes

For ISO5451 OUT to follow IN+ in normal functional mode, $\overline{\text{RST}}$ and RDY must be in high state.

Table 1. Function Table⁽¹⁾

V _{CC1}	V _{CC2}	IN+	IN–	$\overline{\text{RST}}$	RDY	OUT
PU	PD	X	X	X	Low	Low
PD	PU	X	X	X	Low	Low
PU	PU	X	X	Low	High	Low
PU	Open	X	X	X	Low	Low
PU	PU	Low	X	X	High	Low
PU	PU	X	High	X	High	Low
PU	PU	High	Low	High	High	High

(1) PU: Power Up ($V_{CC1} \geq 2.25 \text{ V}$, $V_{CC2} \geq 13 \text{ V}$), PD: Power Down ($V_{CC1} \leq 1.7 \text{ V}$, $V_{CC2} \leq 9.5 \text{ V}$), X: Irrelevant

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The ISO5451 is an isolated gate driver for power semiconductor devices such as IGBTs and MOSFETs. It is intended for use in applications such as motor control, industrial inverters and switched mode power supplies. In these applications, sophisticated PWM control signals are required to turn the power devices on and off, which at the system level eventually may determine, for example, the speed, position, and torque of the motor or the output voltage, frequency and phase of the inverter. These control signals are usually the outputs of a micro controller, and are at low voltage levels such as 3.3 V or 5 V. The gate controls required by the MOSFETs and IGBTs, on the other hand, are in the range of 30 V (using unipolar output supply) to 15 V (using bipolar output supply), and need high current capability to be able to drive the large capacitive loads offered by those power transistors. Not only that, the gate drive needs to be applied with reference to the Emitter of the IGBT (source for MOSFET), and by construction, the Emitter node in a gate drive system may swing between 0 to the DC bus voltage, that can be several hundreds of volts in magnitude.

The ISO5451 is thus used to level shift the incoming 3.3-V and 5-V control signals from the microcontroller to the 30-V (using unipolar output supply) to 15-V (using bipolar output supply) drive required by the power transistors while ensuring high-voltage isolation between the driver side and the microcontroller side.

10.2 Typical Applications

[Figure 42](#) shows the typical application of a three-phase inverter using six ISO5451 isolated gate drivers. Three-phase inverters are used for variable-frequency drives to control the operating speed and torque of AC motors and for high power applications such as High-Voltage DC (HVDC) power transmission.

The basic three-phase inverter consists of six power switches, and each switch is driven by one ISO5451. The switches are driven on and off at high switching frequency with specific patterns that to converter dc bus voltage to three-phase AC voltages.

Typical Applications (continued)

Figure 42. Typical Motor Drive Application

10.2.1 Design Requirements

Unlike optocoupler based gate drivers which need external current drivers and biasing circuitry to provide the input control signals, the input control to the device is CMOS and can be directly driven by the microcontroller. Other design requirements include decoupling capacitors on the input and output supplies, a pullup resistor on the common drain \overline{FLT} output signal and \overline{RST} input signal, and a high-voltage protection diode between the IGBT collector and the DESAT input. Further details are explained in the subsequent sections. Table 2 shows the allowed range for Input and Output supply voltage, and the typical current output available from the gate-driver.

Table 2. Design Parameters

PARAMETER	VALUE
Input supply voltage	3-V to 5.5-V
Unipolar output supply voltage ($V_{CC2} - GND2 = V_{CC2} - V_{EE2}$)	15-V to 30-V
Bipolar output supply voltage ($V_{CC2} - V_{EE2}$)	15-V to 30-V
Bipolar output supply voltage ($GND2 - V_{EE2}$)	0-V to 15-V
Output current	2.5-A

10.2.2 Detailed Design Procedure

10.2.2.1 Recommended ISO5451 Application Circuit

The ISO5451 has both, inverting and non-inverting gate control inputs, an active low reset input, and an open drain fault output suitable for wired-OR applications. The recommended application circuit in Figure 43 shows a typical gate driver implementation with Unipolar Output Supply and Figure 44 shows a typical gate driver implementation with Bipolar Output Supply using the ISO5451.

A 0.1- μF bypass capacitor, recommended at input supply pin V_{CC1} and 1- μF bypass capacitor, recommended at output supply pin V_{CC2} , provide the large transient currents necessary during a switching transition to ensure reliable operation. The 220 pF blanking capacitor disables DESAT detection during the off-to-on transition of the power device. The DESAT diode (D_{DST}) and its 1-k Ω series resistor are external protection components. The R_G gate resistor limits the gate charge current and indirectly controls the IGBT collector voltage rise and fall times. The open-drain $\overline{\text{FLT}}$ output and RDY output has a passive 10-k Ω pullup resistor. In this application, the IGBT gate driver is disabled when a fault is detected and will not resume switching until the microcontroller applies a reset signal.

Figure 43. Unipolar Output Supply

Figure 44. Bipolar Output Supply

10.2.2.2 $\overline{\text{FLT}}$ and RDY Pin Circuitry

There is 50k pullup resistor internally on $\overline{\text{FLT}}$ and RDY pins. The $\overline{\text{FLT}}$ and RDY pin is an open-drain output. A 10-k Ω pullup resistor can be used to make it faster rise and to provide logic high when $\overline{\text{FLT}}$ and RDY is inactive, as shown in Figure 45.

Fast common mode transients can inject noise and glitches on $\overline{\text{FLT}}$ and RDY pins due to parasitic coupling. This is dependent on board layout. If required, additional capacitance (100 pF to 300 pF) can be included on the $\overline{\text{FLT}}$ and RDY pins.

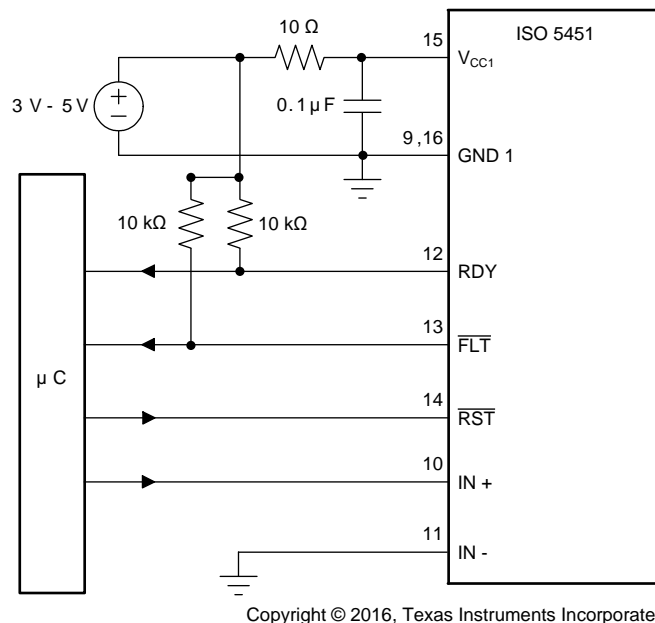

Figure 45. $\overline{\text{FLT}}$ and RDY Pin Circuitry for High CMTI

10.2.2.3 Driving the Control Inputs

The amount of common-mode transient immunity (CMTI) can be curtailed by the capacitive coupling from the high-voltage output circuit to the low-voltage input side of the ISO5451. For maximum CMTI performance, the digital control inputs, IN+ and IN–, must be actively driven by standard CMOS, push-pull drive circuits. This type of low-impedance signal source provides active drive signals that prevent unwanted switching of the ISO5451 output under extreme common-mode transient conditions. Passive drive circuits, such as open-drain configurations using pullup resistors, must be avoided. There is a 20 ns glitch filter which can filter a glitch up to 20 ns on IN+ or IN–.

10.2.2.4 Local Shutdown and Reset

In applications with local shutdown and reset, the $\overline{\text{FLT}}$ output of each gate driver is polled separately, and the individual reset lines are asserted low independently to reset the motor controller after a fault condition.

Figure 46. Local Shutdown and Reset for Noninverting (left) and Inverting Input Configuration (right)

10.2.2.5 Global-Shutdown and Reset

When configured for inverting operation, the ISO5451 can be configured to shutdown automatically in the event of a fault condition by tying the $\overline{\text{FLT}}$ output to IN+. For high reliability drives, the open drain $\overline{\text{FLT}}$ outputs of multiple ISO5451 devices can be wired together forming a single, common fault bus for interfacing directly to the micro-controller. When any of the six gate drivers of a three-phase inverter detects a fault, the active low $\overline{\text{FLT}}$ output disables all six gate drivers simultaneously.

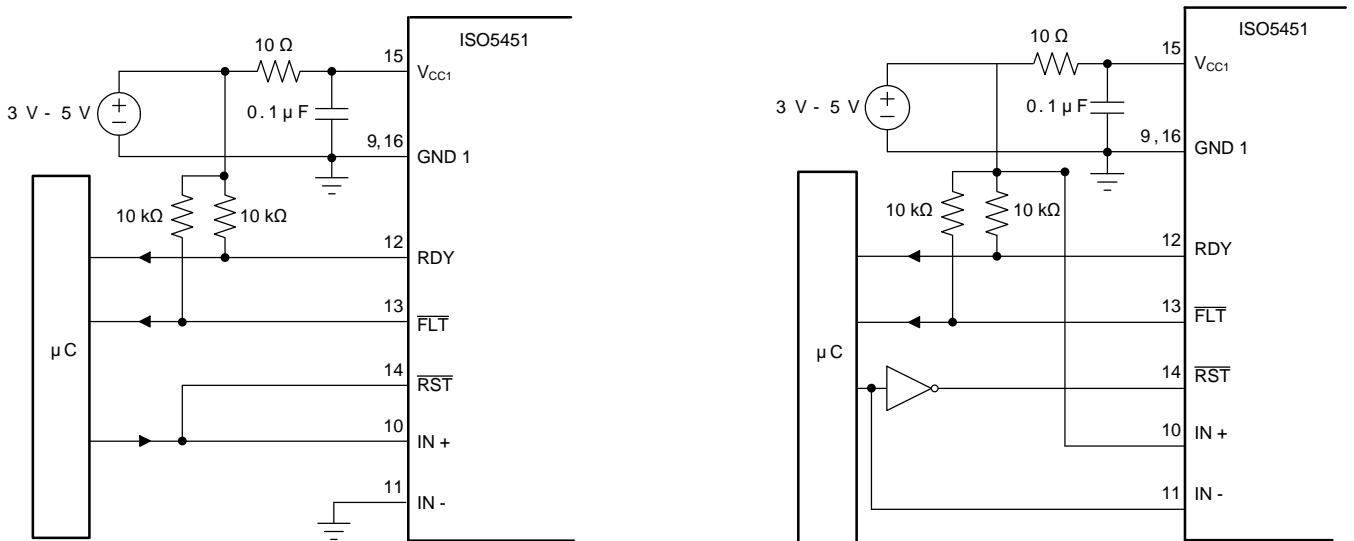

Copyright © 2016, Texas Instruments Incorporated

Figure 47. Global Shutdown With Inverting Input Configuration

10.2.2.6 Auto-Reset

In this case, the gate control signal at IN+ is also applied to the RST input to reset the fault latch every switching cycle. Incorrect RST makes output go low. A fault condition, however, the gate driver remains in the latched fault state until the gate driver remains in the latched fault state until the gate control signal changes to the gate low state and resets the fault latch.

If the gate control signal is a continuous PWM signal, the fault latch will always be reset before IN+ goes high again. This configuration protects the IGBT on a cycle by cycle basis and automatically resets before the next 'on' cycle.

Copyright © 2016, Texas Instruments Incorporated

Figure 48. Auto Reset for Noninverting and Inverting Input Configuration

10.2.2.7 DESAT Pin Protection

Switching inductive loads causes large instantaneous forward voltage transients across the freewheeling diodes of IGBTs. These transients result in large negative voltage spikes on the DESAT pin which draw substantial current out of the device. To limit this current below damaging levels, a 100-Ω to 1-kΩ resistor is connected in series with the DESAT diode.

Further protection is possible through an optional Schottky diode, whose low forward voltage assures clamping of the DESAT input to GND2 potential at low voltage levels.

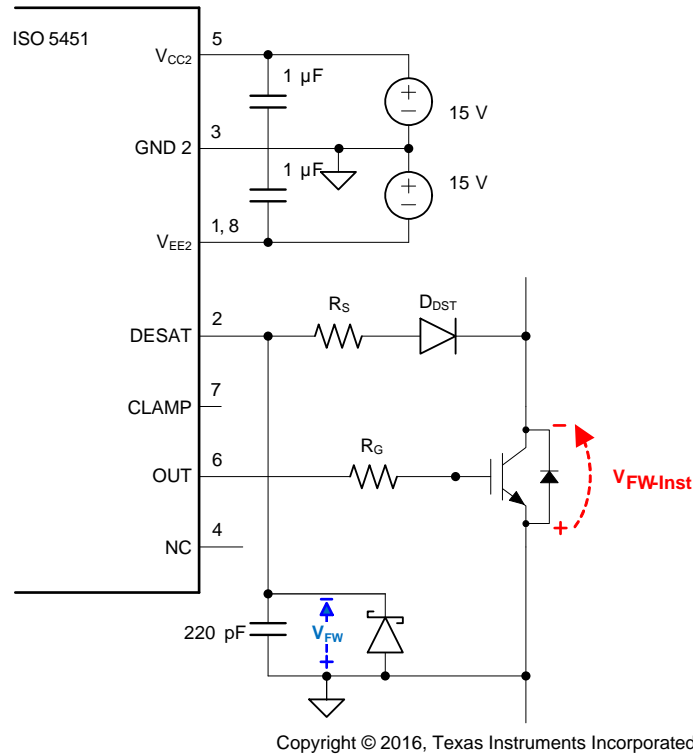

Figure 49. DESAT Pin Protection with Series Resistor and Schottky Diode

10.2.2.8 DESAT Diode and DESAT Threshold

The DESAT diode’s function is to conduct forward current, allowing sensing of the IGBT’s saturated collector-to-emitter voltage, $V_{(CESAT)}$, (when the IGBT is *on*) and to block high voltages (when the IGBT is *off*). During the short transition time when the IGBT is switching, there is commonly a high dV_{CE}/dt voltage ramp rate across the IGBT. This results in a charging current $I_{(CHARGE)} = C_{(D-DESAT)} \times dV_{CE}/dt$, charging the blanking capacitor. $C_{(D-DESAT)}$ is the diode capacitance at DESAT.

To minimize this current and avoid false DESAT triggering, fast switching diodes with low capacitance are recommended. As the diode capacitance builds a voltage divider with the blanking capacitor, large collector voltage transients appear at DESAT attenuated by the ratio of $1 + C_{(BLANK)} / C_{(D-DESAT)}$.

Because the sum of the DESAT diode forward-voltage and the IGBT collector-emitter voltage make up the voltage at the DESAT-pin, $V_F + V_{CE} = V_{(DESAT)}$, the V_{CE} level, which triggers a fault condition, can be modified by adding multiple DESAT diodes in series: $V_{CE-FAULT(TH)} = 9V - n \times V_F$ (where n is the number of DESAT diodes).

When using two diodes instead of one, diodes with half the required maximum reverse-voltage rating may be chosen.

10.2.2.9 Determining the Maximum Available, Dynamic Output Power, P_{OD-max}

The ISO5451 maximum allowed total power consumption of $P_D = 251$ mW consists of the total input power, P_{ID} , the total output power, P_{OD} , and the output power under load, P_{OL} :

$$P_D = P_{ID} + P_{OD} + P_{OL} \tag{1}$$

With:

$$P_{ID} = V_{CC1-max} \times I_{CC1-max} = 5.5 \text{ V} \times 4.5 \text{ mA} = 24.75 \text{ mW} \tag{2}$$

and:

$$P_{OD} = (V_{CC2} - V_{EE2}) \times I_{CC2-max} = (15\text{V} - (-8\text{V})) \times 6 \text{ mA} = 138 \text{ mW} \tag{3}$$

then:

$$P_{OL} = P_D - P_{ID} - P_{OD} = 251 \text{ mW} - 24.75 \text{ mW} - 138 \text{ mW} = 88.25 \text{ mW} \tag{4}$$

In comparison to P_{OL} , the actual dynamic output power under worst case condition, P_{OL-WC} , depends on a variety of parameters:

$$P_{OL-WC} = 0.5 \times f_{INP} \times Q_G \times (V_{CC2} - V_{EE2}) \times \left(\frac{r_{on-max}}{r_{on-max} + R_G} + \frac{r_{off-max}}{r_{off-max} + R_G} \right)$$

where

- f_{INP} = signal frequency at the control input IN+
 - Q_G = power device gate charge
 - V_{CC2} = positive output supply with respect to GND2
 - V_{EE2} = negative output supply with respect to GND2
 - r_{on-max} = worst case output resistance in the on-state: 4 Ω
 - $r_{off-max}$ = worst case output resistance in the off-state: 2.5 Ω
 - R_G = gate resistor
- (5)

Once R_G is determined, Equation 5 is to be used to verify whether $P_{OL-WC} < P_{OL}$. Figure 50 shows a simplified output stage model for calculating P_{OL-WC} .

Copyright © 2016, Texas Instruments Incorporated

Figure 50. Simplified Output Model for Calculating P_{OL-WC}

10.2.2.10 Example

This examples considers an IGBT drive with the following parameters:

$$I_{ON-PK} = 2 \text{ A}, Q_G = 650 \text{ nC}, f_{INP} = 20 \text{ kHz}, V_{CC2} = 15\text{V}, V_{EE2} = -8 \text{ V} \tag{6}$$

Apply the value of the gate resistor $R_G = 10 \Omega$.

Then, calculating the worst-case output power consumption as a function of R_G , using Equation 5 r_{on-max} = worst case output resistance in the on-state: 4Ω , $r_{off-max}$ = worst case output resistance in the off-state: 2.5Ω , R_G = gate resistor yields

$$P_{OL-WC} = 0.5 \times 20 \text{ kHz} \times 650 \text{ nC} \times (15 \text{ V} - (-8 \text{ V})) \times \left(\frac{4 \Omega}{4 \Omega + 10 \Omega} + \frac{2.5 \Omega}{2.5 \Omega + 10 \Omega} \right) = 72.61 \text{ mW} \tag{7}$$

Because $P_{OL-WC} = 72.61 \text{ mW}$ is below the calculated maximum of $P_{OL} = 88.25 \text{ mW}$, the resistor value of $R_G = 10 \Omega$ is suitable for this application.

10.2.2.11 Higher Output Current Using an External Current Buffer

To increase the IGBT gate drive current, a non-inverting current buffer (such as the npn/pnp buffer shown in Figure 51) may be used. Inverting types are not compatible with the desaturation fault protection circuitry and must be avoided. The MJD44H11/MJD45H11 pair is appropriate for currents up to 8 A, the D44VH10/D45VH10 pair for up to 15 A maximum.

Figure 51. Current Buffer for Increased Drive Current

10.2.3 Application Curves

Figure 52. Normal Operation - Bipolar Supply

Figure 53. Normal Operation - Unipolar Supply

11 Power Supply Recommendations

To help ensure reliable operation at all data rates and supply voltages, a 0.1- μF bypass capacitor is recommended at input supply pin V_{CC1} and 1- μF bypass capacitor is recommended at output supply pin V_{CC2} . The capacitors should be placed as close to the supply pins as possible. The recommended placement of capacitors is 2-mm maximum from input and output power supply pin (V_{CC1} and V_{CC2}).

12 Layout

12.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 54](#)). Layer stacking should be in the following order (top-to-bottom): high-current or sensitive signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-current or sensitive traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the gate driver and the microcontroller and power transistors. Gate driver control input, Gate driver output OUT and DESAT should be routed in the top layer.
- Placing a solid ground plane next to the sensitive signal layer provides an excellent low-inductance path for the return current flow. On the driver side, use GND2 as the ground plane.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/inch². On the gate-driver V_{EE2} and V_{CC2} can be used as power planes. They can share the same layer on the PCB as long as they are not connected together.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

For detailed layout recommendations, see the [Digital Isolator Design Guide](#) (SLLA284).

12.2 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

13.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

13.6 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

DW0016B

PACKAGE OUTLINE

SOIC - 2.65 mm max height

SOIC

4221009/B 07/2016

NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.
5. Reference JEDEC registration MS-013.

EXAMPLE BOARD LAYOUT

DW0016B

SOIC - 2.65 mm max height

SOIC

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DW0016B

SOIC - 2.65 mm max height

SOIC

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ISO5451DW	ACTIVE	SOIC	DW	16	40	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 125	ISO5451	Samples
ISO5451DWR	ACTIVE	SOIC	DW	16	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 125	ISO5451	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF ISO5451 :

- Automotive: [ISO5451-Q1](#)

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
