

# LP3988 Micropower, 150-mA Ultra-Low-Dropout CMOS Voltage Regulator With Power Good

## 1 Features

- Input Voltage Range: 2.5 V to 6 V
- Output Current: 150 mA
- PSRR at 10 kHz: 40 dB
- Quiescent Current When Shut Down:  $\leq 1\mu\text{A}$
- Fast Turnon Time: 100  $\mu\text{s}$  (Typical)
- Dropout With 150-mA load: 80 mV (Typical)
- Junction Temperature Range for Operation:  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- Power-Good Flag Output
- Logic Controlled Enable
- Thermal Shutdown and Short-Circuit Current Limit
- Stable with Ceramic and High-Quality Tantalum Capacitors

## 2 Applications

- CDMA Cellular Handsets
- Wideband CDMA Cellular Handsets
- GSM Cellular Handsets
- Portable Information Appliances
- Tiny 3.3 V  $\pm 5\%$  to 2.85 V, 150-mA Converter

## 3 Description

The LP3988 is a 150-mA low dropout regulator designed specially to meet requirements of portable battery applications. The LP3988 is designed to work with space-saving, small 1- $\mu\text{F}$  ceramic capacitors. The LP3988 features a Power Good (PG) output that indicates a faulty output condition. The device is ideal for mobile phone and similar battery-powered wireless applications. It provides up to 150 mA output current from a 2.5-V to 6-V input, consuming less than 1  $\mu\text{A}$  in disable mode and has fast turnon time less than 200  $\mu\text{s}$ .

The LP3988 device's performance is optimized for battery-powered systems to deliver low noise, extremely low dropout voltage, and low quiescent current. Regulator ground current increases only slightly in dropout, further prolonging the battery life.

Power supply rejection is better than 60 dB at low frequencies and starts to roll off at 10 kHz. High power-supply rejection is maintained down to lower input-voltage levels common to battery-operated circuits.

The LP3988 is available in a 5-pin SOT-23 package and a 5-pin thin DSBGA package. Performance is specified for  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  temperature range. For all available output voltage and package options, see the Package Option Addendum (POA) at the end of the data sheet.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LP3988	SOT-23 (5)	2.90 mm x 1.60 mm
	DSBGA (5)	1.502 mm x 1.045 mm <sup>(2)</sup>

(1) For all available packages, see the orderable addendum at the end of the data sheet.

(2) Body size dimension is maximum.

### Pin Functions

PIN			TYPE	DESCRIPTION
NAME	DSBGA	SOT-23		
EN	A1	3	Input	Enable input logic, enable high
GND	B2	2	Ground	Common ground
IN	C3	1	Input	Input voltage of the LDO
PG	A3	4	Output	Power Good flag (output): open-drain output, connected to an external pullup resistor. Active low indicates an output voltage out of tolerance condition.
OUT	C1	5	Output	Output voltage of the LDO

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)(3)</sup>

		MIN	MAX	UNIT
IN pin		-0.3	6.5	V
OUT, EN, PG pins		-0.3	See <sup>(4)</sup>	V
Junction temperature, T <sub>J</sub>			150	°C
Power dissipation <sup>(5)</sup>	SOT-23-5		469	mW
	DSBGA		441	
Storage temperature, T <sub>stg</sub>		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to the potential at the GND pin.
- (3) If Military/Aerospace specified devices are required, contact the Texas Instruments Sales Office/ Distributors for availability and specifications.
- (4) The lesser of V<sub>IN</sub> + 0.3 V or 6 V.
- (5) The absolute maximum power dissipation depends on the ambient temperature and the R<sub>θJA</sub> value; it can be calculated using the formula: P<sub>D</sub> = (T<sub>J</sub> - T<sub>A</sub>)/R<sub>θJA</sub> where T<sub>J(MAX)</sub> is the maximum junction temperature, T<sub>A(MAX)</sub> is the maximum expected ambient temperature, and R<sub>θJA</sub> is the junction-to-ambient thermal resistance. The 469-mW rating for the SOT-23-5 package results from substituting the junction temperature, 150°C, for T<sub>J(MAX)</sub>, 70°C for T<sub>A</sub>, and 181.2°C/W for R<sub>θJA</sub>. More power can be dissipated safely at ambient temperatures below 70°C. Less power can be dissipated safely at ambient temperatures above 70°C. The absolute maximum power dissipation can be increased by 5.86 mW for each degree below 70°C, and it must be derated by 5.86 mW for each degree above 70°C. Same principle applies to the DSBGA package.

### 6.2 ESD Ratings

			VALUE	UNIT
<b>LP3988 IN SOT-23 PACKAGE</b>				
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±150	
<b>LP3988 IN DSBGA PACKAGE</b>				
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±200	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

 over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)</sup>

		MIN	NOM	MAX	UNIT
V <sub>IN</sub>		2.5 <sup>(3)</sup>		6	V
V <sub>OUT</sub> , V <sub>EN</sub>		0		V <sub>IN</sub>	V
V <sub>PG</sub>		0		6	V
I <sub>PG</sub>		0		500	μA
Junction temperature, T <sub>J</sub>		–40		125	°C
Maximum power dissipation <sup>(4)</sup>	SOT-23			322	mW
	DSBGA			303	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to the potential at the GND pin.
- (3) The minimum V<sub>IN</sub> is dependant on the device output option. For V<sub>OUT(NOM)</sub> < 2.5 V, V<sub>IN(MIN)</sub> equals 2.5 V. For V<sub>OUT(NOM)</sub> ≥ 2.5 V, V<sub>IN(MIN)</sub> equals V<sub>OUT(NOM)</sub> + 200 mV.
- (4) Like the Absolute Maximum power dissipation, the maximum power dissipation for operation depends on the ambient temperature. The 322-mW rating appearing under *Recommended Operating Conditions* for the SOT-23-5 package results from substituting the maximum junction temperature for operation, 125°C, for T<sub>J(MAX)</sub>, 70°C for T<sub>A(MAX)</sub>, and 181.2°C/W for R<sub>θJA</sub>. More power can be dissipated at ambient temperatures below 70°C. Less power can be dissipated at ambient temperatures above 70°C. The maximum power dissipation for operation can be increased by 4.5 mW for each degree below 70°C, and it must be derated by 5.86 mW for each degree above 70°C. The same principle applies to the DSBGA package.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LP3988		UNIT
		DBV (SOT-23)	YZR (DSBGA)	
		5 PINS	5 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	170.5	181.2	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	124.4	0.8	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	30.9	107.9	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	17.6	0.5	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	30.4	107.9	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	n/a	n/a	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

Unless otherwise specified:  $V_{EN} = 1.8\text{ V}$ ,  $V_{IN} = V_{OUT} + 0.5\text{ V}$ ,  $C_{IN} = 1\text{ }\mu\text{F}$ ,  $I_{OUT} = 1\text{ mA}$ ,  $C_{OUT} = 1\text{ }\mu\text{F}$ ; typical values and limits are for  $T_J = 25^\circ\text{C}$ , and minimum and maximum values and limits apply over the entire junction temperature range for operation,  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ .<sup>(1)(2)</sup>

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$\Delta V_{OUT}$	Output voltage tolerance	$-20^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$ , SOT-23-5	-2		2	% of $V_{OUT(NOM)}$
		SOT-23-5	-3		3	
		DSBGA	-3.5		3.5	
	Line regulation error	$V_{IN} = V_{OUT(NOM)} + 0.5\text{ V}$ to $6\text{ V}$ $T_J = 25^\circ\text{C}$	-0.15		0.15	%V
		$V_{IN} = V_{OUT(NOM)} + 0.5\text{ V}$ to $6\text{ V}$	-0.2		0.2	
	Load regulation error <sup>(3)</sup>	$I_{OUT} = 1\text{ mA}$ to $150\text{ mA}$ , $T_J = 25^\circ\text{C}$				0.005
$I_{OUT} = 1\text{ mA}$ to $150\text{ mA}$					0.007	
PSRR	Power Supply Rejection Ratio	$V_{IN} = V_{OUT(NOM)} + 1\text{ V}$ , $f = 1\text{ kHz}$ , $I_{OUT} = 50\text{ mA}$ (See Figure 11)		65		dB
		$V_{IN} = V_{OUT(NOM)} + 1\text{ V}$ , $f = 10\text{ kHz}$ , $I_{OUT} = 50\text{ mA}$ (See Figure 11)		45		
$I_Q$	Quiescent current	$V_{EN} = 1.4\text{ V}$ , $I_{OUT} = 0\text{ mA}$ , $T_J = 25^\circ\text{C}$		85	120	$\mu\text{A}$
		$V_{EN} = 1.4\text{ V}$ , $I_{OUT} = 0$ to $150\text{ mA}$		140	200	
		$V_{EN} = 0.4\text{ V}$		0.003	1	
	Dropout voltage <sup>(4)</sup>	$I_{OUT} = 1\text{ mA}$		1	5	mV
		$I_{OUT} = 150\text{ mA}$ , $T_J = 25^\circ\text{C}$		80	115	
		$I_{OUT} = 150\text{ mA}$			150	
$I_{SC}$	Short circuit current limit	See <sup>(5)</sup>		600		mA
$e_n$	Output noise voltage	BW = 10 Hz to 100 kHz, $C_{OUT} = 1\text{ }\mu\text{F}$		220		$\mu\text{V}_{RMS}$
$C_{OUT}$	Output capacitor	Capacitance <sup>(6)</sup>	1		20	$\mu\text{F}$
		ESR <sup>(6)</sup>	5		500	m $\Omega$
TSD	Thermal shutdown temperature			160		$^\circ\text{C}$
	Thermal shutdown hysteresis			20		
<b>ENABLE CONTROL CHARACTERISTICS</b>						
$I_{EN}$	Maximum input current at EN	$V_{EN} = 0\text{ V}$ and $V_{IN} = 6\text{ V}$			0.1	$\mu\text{A}$
$V_{IL}$	Logic low input threshold	$V_{IN} = 2.5\text{ V}$ to $6\text{ V}$			0.5	V
$V_{IH}$	Logic high input threshold	$V_{IN} = 2.5\text{ V}$ to $6\text{ V}$	1.2			V

- (1) All electrical characteristics having room-temperature limits are tested during production with  $T_J = 25^\circ\text{C}$  or correlated using Statistical Quality Control (SQC) methods. All hot and cold limits are specified by correlating the electrical characteristics to process and temperature variations and applying statistical process control.
- (2) The target output voltage, which is labeled  $V_{OUT(NOM)}$ , is the desired voltage option.
- (3) An increase in the load current results in a slight decrease in the output voltage and vice versa.
- (4) Dropout voltage is the input-to-output voltage difference at which the output voltage is 100 mV below its nominal value.
- (5) Short-circuit current is measured on input supply line after pulling down  $V_{OUT}$  to 95%  $V_{OUT(NOM)}$ .
- (6) Specified by design. Not production tested. The capacitor tolerance should be  $\pm 30\%$  or better over the full temperature range. The full range of operating conditions such as temperature, DC bias and even capacitor case size for the capacitor in the application should be considered during device selection to ensure this minimum capacitance specification is met. X7R capacitor types are recommended to meet the full device temperature range.

### Electrical Characteristics (continued)

Unless otherwise specified:  $V_{EN} = 1.8\text{ V}$ ,  $V_{IN} = V_{OUT} + 0.5\text{ V}$ ,  $C_{IN} = 1\text{ }\mu\text{F}$ ,  $I_{OUT} = 1\text{ mA}$ ,  $C_{OUT} = 1\text{ }\mu\text{F}$ ; typical values and limits are for  $T_J = 25^\circ\text{C}$ , and minimum and maximum values and limits apply over the entire junction temperature range for operation,  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ .<sup>(1)(2)</sup>

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT		
<b>POWER GOOD</b>							
$V_{THL}$	PG low threshold (See Figure 10)	% of $V_{OUT}$ (PG ON), $T_J = 25^\circ\text{C}$		90%	93%	95%	
$V_{THH}$	PG high threshold (See Figure 10)	% of $V_{OUT}$ (PG OFF), $T_J = 25^\circ\text{C}$ <sup>(7)</sup>		92%	95%	98%	
$V_{OL}$	PG output logic low voltage	$I_{PULLUP} = 100\text{ }\mu\text{A}$ , fault condition			0.02	0.1	V
$I_{PGL}$	PG output leakage current	PG off, $V_{PG} = 6\text{ V}$			0.02		$\mu\text{A}$

(7) The low and high thresholds are generated together. Typically a 2.6% difference is seen between these thresholds.

### 6.6 Timing Requirements

		MIN	NOM	MAX	UNIT
$T_{ON}$	PG turnon time <sup>(1)</sup> , $V_{IN} = 4.2\text{ V}$		10		$\mu\text{s}$
$T_{OFF}$	PG turnoff time <sup>(1)</sup> , $V_{IN} = 4.2\text{ V}$		10		$\mu\text{s}$

(1) Turnon time is time measured between the enable input just exceeding  $V_{IH}$  and the output voltage just reaching 95% of its nominal value.

### 6.7 Typical Characteristics

Unless otherwise specified,  $C_{IN} = C_{OUT} = 1\text{ }\mu\text{F}$  ceramic,  $V_{IN} = V_{OUT} + 0.2\text{ V}$ ,  $T_A = 25^\circ\text{C}$ , EN pin is tied to  $V_{IN}$ .

**Typical Characteristics (continued)**

 Unless otherwise specified,  $C_{IN} = C_{OUT} = 1 \mu\text{F}$  ceramic,  $V_{IN} = V_{OUT} + 0.2 \text{ V}$ ,  $T_A = 25^\circ\text{C}$ , EN pin is tied to  $V_{IN}$ .

## 8 Detailed Description

### 8.1 Overview

The LP3988 is a combination of a low-dropout linear regulator with an enable function, along with a Power Good (PG) output. The enable function allows the LP3988 output to be selectively enabled, or disabled, as needed. The PG output goes high when the LP3988 output voltage is typically above 95% of nominal.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Enable (EN)

A high input on the EN pin ( $V_{EN} \geq V_{IH}$ ) activates the device which turns the regulator to an ON state. A low input on the EN pin ( $V_{EN} \leq V_{IL}$ ) disables the device which turns the regulator to an OFF state. Operating with  $V_{EN}$  between the  $V_{IL}$  and the  $V_{IH}$  thresholds is not recommended as the device status cannot be assured. For self-bias applications where the EN function is not needed, connect the EN pin to the IN pin.

#### 8.3.2 Regulated Output (OUT)

The OUT pin is the regulated output voltage based on the internally pre-programmed voltage. The output has current limitation. In the event that the regulator drops out of regulation due to low input voltage, the output tracks the input minus a drop based on the load current. There is no UVLO circuitry. Device behavior is undefined when  $V_{IN}$  is below the minimum operating input voltage of either 2.5 V, or  $V_{OUT} + 200$  mV, whichever is greater.

#### 8.3.3 Power Good (PG) Output

The PG pin is an open-drain output and can be pulled up to any 6 V, or lower rail through an external pullup resistor. The PG pin is high-impedance when  $V_{OUT}$  is greater than the PG trip high threshold ( $V_{THH}$ ). If  $V_{OUT}$  is less than the PG trip low threshold ( $V_{THL}$ ), the open-drain output turns on and pulls the PG output low. If output voltage monitoring is not needed, the PG pin can be left floating or connected to GND. The behavior of the power-good feature is not ensured when  $V_{IN}$  is less than 2.5 V.

#### 8.3.4 PG Delay Time

The power-good delay times ( $t_{ON}$ ,  $t_{OFF}$ ) are defined as the time period from when  $V_{OUT}$  crosses either the PG high trip threshold voltage ( $V_{THH}$ ), or the PG low trip threshold voltage ( $V_{THL}$ ), to when the PG output changes to the appropriate state. The power-good delay times are set internally, and both are typically 10  $\mu$ s. There is no external adjustment available to alter the delay times.

## Feature Description (continued)

### 8.3.5 Current Limit

The fixed current limit ( $I_{SC}$ ) of the LP3988 helps protect the regulator during output fault conditions. The maximum amount of current the device can source is typically 600 mA, and is largely independent of input and output voltage. For reliable operation, do not operate the device in current limit for extended periods of time. Depending on power dissipation, thermal resistance, and ambient temperature, operating at the current limit may activate the thermal shutdown circuitry.

### 8.3.6 Thermal Shutdown ( $T_{SD}$ )

Thermal shutdown ( $T_{SD}$ ) protection disables the output when the junction temperature rises to approximately 160°C. This shutdown causes the device dissipation to go to zero, which allows the device to cool. When the device junction temperature cools to approximately 140°C, the output circuitry is automatically enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle ON and OFF. This cycling limits the dissipation of the regulator, protecting it from damage as a result of overheating. The thermal shutdown circuitry of the LP3988 has been designed to protect against temporary thermal overload conditions. The  $T_{SD}$  circuitry was not intended to replace proper heat-sinking. Continuously running the LP3988 device in  $T_{SD}$  may degrade device reliability and lifetime.

### 8.3.7 Fast Turnon Time

The LP3988 utilizes a speed up circuitry to ramp up the internal  $V_{REF}$  voltage to its final value to achieve a fast output turnon time.

## 8.4 Device Functional Modes

### 8.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage ( $V_{IN}$ ) is at least either 2.5 V, or  $V_{OUT} + 200$  mV, whichever is greater.
- The enable voltage ( $V_{EN}$ ) is at least 1.2 V ( $V_{IH}$ ).
- The output current is no more than the maximum rated current of 150 mA.
- The device junction temperature ( $T_J$ ) is no more than the maximum specified operating junction temperature.

### 8.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage ( $V_{DO}$ ), but all other conditions are met for normal operation, the device operates in dropout mode. In this mode of operation, the output voltage is the same as the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass device (PMOS transistor), no longer controls the current through the LDO. Line or load transients while operating in dropout can result in large output voltage deviations.

### 8.4.3 Disabled

The device is disabled under the following conditions:

- $V_{EN}$  is no more than 0.6 V ( $V_{IL}$ ).
- $T_J$  is greater than the thermal shutdown temperature.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The LP3988 voltage regulator offers the benefit of ultra-low-dropout voltage, low noise, very low standby current, and miniaturized surface-mount packaging. The LP3988 is designed for continuous, or sporadic (power backup), battery-operated applications where very low standby current is critical to extending system battery life.

### 9.2 Typical Application

Figure 12. LP3988 Typical Application

#### 9.2.1 Design Requirements

For typical CMOS voltage regulator applications, use the parameters listed in [Table 1](#).

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Minimum input voltage	2.5 V
Output voltages	various
Output current	150 mA

#### 9.2.2 Detailed Design Procedure

##### 9.2.2.1 External Capacitors

Like any low-dropout regulator, the LP3988 requires external capacitors for regulator stability. The LP3988 is specifically designed for portable applications requiring minimum board space and smallest components. These capacitors must be correctly selected for good performance.

##### 9.2.2.2 Input Capacitor

An input capacitance of at least 1 µF is required between the LP3988 IN pin and ground (the amount of the capacitance may be increased without limit). This capacitor must be located a distance of not more than 1cm from the input pin and returned to a clean analog ground. Any good quality ceramic, tantalum, or film capacitor may be used at the input

#### NOTE

Tantalum capacitors can suffer catastrophic failures due to surge current when connected to a low-impedance source of power (like a battery or a very large capacitor). If a tantalum capacitor is used at the input, it must be ensured by the manufacturer to have a surge current rating sufficient for the application.

There are no requirements for the equivalent series resistance (ESR) on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance is at least 1  $\mu\text{F}$  over the entire operating temperature range.

#### 9.2.2.3 Output Capacitors

The LP3988 is designed specifically to work with very small ceramic output capacitors. A ceramic capacitor (dielectric types Z5U, Y5V or X7R) in 1- $\mu\text{F}$  to 22- $\mu\text{F}$  range with 5-m $\Omega$  to 500-m $\Omega$  ESR range is suitable in the LP3988 application circuit.

It may also be possible to use tantalum or film capacitors at the output, but these are not as attractive for reasons of size and cost (see [Capacitor Characteristics](#)).

The output capacitor must meet the requirement for minimum amount of capacitance and also have an ESR value which is within a stable range (5 m $\Omega$  to 500 m $\Omega$ ).

#### 9.2.2.4 No-Load Stability

The LP3988 remains stable and in regulation with no external load. This is specially important in CMOS RAM keep-alive applications.

#### 9.2.2.5 Capacitor Characteristics

The LP3988 is designed to work with ceramic capacitors on the output to take advantage of the benefits they offer: for capacitance values in the range of 1  $\mu\text{F}$  to 4.7  $\mu\text{F}$  range, ceramic capacitors are the smallest, least expensive and have the lowest ESR values (which makes them best for eliminating high frequency noise). The ESR of a typical 1- $\mu\text{F}$  ceramic capacitor is in the range of 20 m $\Omega$  to 40 m $\Omega$ , which easily meets the ESR requirement for stability by the LP3988.

Capacitance of the ceramic capacitor can vary with temperature. Most large-value ceramic capacitors (around 2.2  $\mu\text{F}$ ) are manufactured with Z5U or Y5V temperature characteristics, which results in the capacitance dropping by more than 50% as the temperature goes from 25°C to 85°C. A better choice for temperature coefficient in a ceramic capacitor is X7R, which holds the capacitance within  $\pm 15\%$ .

Tantalum capacitors are less desirable than ceramic for use as output capacitors because they are more expensive when comparing equivalent capacitance and voltage ratings in the 1- $\mu\text{F}$  to 4.7- $\mu\text{F}$  range.

Another important consideration is that tantalum capacitors have higher ESR values than equivalent size ceramics. This means that while it may be possible to find a tantalum capacitor with an ESR value within the stable range, it would have to be larger in capacitance (which means bigger and more costly ) than a ceramic capacitor with the same ESR value. The ESR of a typical tantalum increases about 2:1 as the temperature goes from 25°C down to -40°C, so some guard band must be allowed.

#### 9.2.2.6 Power Dissipation

Knowing the device power dissipation and proper sizing of the thermal plane connected to the tab or pad is critical to ensuring reliable operation. Device power dissipation depends on input voltage, output voltage, and load conditions and can be calculated with [Equation 1](#).

$$P_{D(\text{MAX})} = (V_{\text{IN}(\text{MAX})} - V_{\text{OUT}}) \times I_{\text{OUT}(\text{MAX})} \quad (1)$$

Power dissipation can be minimized, and greater efficiency can be achieved, by using the lowest available voltage drop option that would still be greater than the dropout voltage ( $V_{\text{DO}}$ ). However, keep in mind that higher voltage drops result in better dynamic (that is, PSRR and transient) performance.

On the DSBGA (YKA) package, the primary conduction path for heat is through the four bumps to the PCB.

On the SOT-23 (BDV) package, the primary conduction path for heat is through the device leads to the PCB, predominately device lead 2 (GND). It is recommended that the trace from lead 2 be extended under the package body and connected to an internal ground plane with thermal vias.

The maximum allowable junction temperature ( $T_{J(MAX)}$ ) determines maximum power dissipation allowed ( $P_{D(MAX)}$ ) for the device package.

Power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ( $R_{\theta JA}$ ) of the combined PCB and device package and the temperature of the ambient air ( $T_A$ ), according to [Equation 2](#) or [Equation 3](#):

$$T_{J(MAX)} = T_{A(MAX)} + (R_{\theta JA} \times P_{D(MAX)}) \quad (2)$$

$$P_{D(MAX)} = (T_{J(MAX)} - T_{A(MAX)}) / R_{\theta JA} \quad (3)$$

Unfortunately, this  $R_{\theta JA}$  is highly dependent on the heat-spreading capability of the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The  $R_{\theta JA}$  recorded in [Thermal Information](#) is determined by the specific EIA/JEDEC JESD51-7 standard for PCB and copper-spreading area, and is to be used only as a relative measure of package thermal performance. For a well-designed thermal layout,  $R_{\theta JA}$  is actually the sum of the package junction-to-case (bottom) thermal resistance ( $R_{\theta JCBOT}$ ) plus the thermal resistance contribution by the PCB copper area acting as a heat sink.

### 9.2.2.7 Estimating Junction Temperature

The EIA/JEDEC standard recommends the use of psi ( $\Psi$ ) thermal characteristics to estimate the junction temperatures of surface mount devices on a typical PCB board application. These characteristics are not true thermal resistance values, but rather package specific thermal characteristics that offer practical and relative means of estimating junction temperatures. These psi metrics are determined to be significantly independent of copper-spreading area. The key thermal characteristics ( $\Psi_{JT}$  and  $\Psi_{JB}$ ) are given in [Thermal Information](#) and are used in accordance with [Equation 4](#) or [Equation 5](#).

$$T_{J(MAX)} = T_{TOP} + (\Psi_{JT} \times P_{D(MAX)})$$

where

- $P_{D(MAX)}$  is explained in [Equation 1](#).
- $T_{TOP}$  is the temperature measured at the center-top of the device package. (4)

$$T_{J(MAX)} = T_{BOARD} + (\Psi_{JB} \times P_{D(MAX)})$$

where

- $P_{D(MAX)}$  is explained in [Equation 1](#).
- $T_{BOARD}$  is the PCB surface temperature measured 1-mm from the device package and centered on the package edge. (5)

For more information about the thermal characteristics  $\Psi_{JT}$  and  $\Psi_{JB}$ , see the TI Application Report: *Semiconductor and IC Package Thermal Metrics (SPRA953)*, available for download at [www.ti.com](http://www.ti.com).

For more information about measuring  $T_{TOP}$  and  $T_{BOARD}$ , see the TI Application Report: *Using New Thermal Metrics (SBVA025)*, available for download at [www.ti.com](http://www.ti.com).

For more information about the EIA/JEDEC JESD51 PCB used for validating  $R_{\theta JA}$ , see the TI Application Report: *Thermal Characteristics of Linear and Logic Packages Using JEDEC PCB Designs (SZZA017)*, available for download at [www.ti.com](http://www.ti.com).

### 9.2.3 Application Curves

**Figure 13. Line Transient Response (LP3988-2.85 V)**

**Figure 14. Line Transient Response (LP3988-2.85 V)**

**Figure 15. Load Transient Response**

**Figure 16. Load Transient Response**

## 10 Power Supply Recommendations

The LP3988 device is designed to operate from an input supply voltage range of 2.5 V to 6 V. The input supply must be well regulated and free of spurious noise. To ensure that the LP3988 output voltage is well regulated and dynamic performance is optimum, the input supply voltage is recommended to be at least the greater of either  $V_{OUT} + 200\text{ mV}$ , or 2.5 V.

## 11 Layout

### 11.1 Layout Guidelines

The dynamic performance of the LP3988 is dependant on the layout of the PCB. PCB layout practices that are adequate for typical LDOs may degrade the PSRR, noise, or transient performance of the LP3988.

Best performance is achieved by placing  $C_{IN}$  and  $C_{OUT}$  on the same side of the PCB as the LP3988 device, and as close as is practical to the package. The ground connections for  $C_{IN}$  and  $C_{OUT}$  must be back to the LP3988 GND pin using as wide and as short of a copper trace as is practical.

Avoid connections using long trace lengths, narrow trace widths, and/or connections through vias. These add parasitic inductances and resistance that results in inferior performance especially during transient conditions.

The PG pin pullup resistor should be connected to the LP3988 OUT pin, with the pullup resistor located as close to the PG pin as is practical.

### 11.2 Layout Examples

Figure 17. LP3988 SOT-23 Layout Example

Figure 18. LP3988 DSBGA Layout Example

### 11.3 DSBGA Mounting

The DSBGA package requires specific mounting techniques, which are detailed in TI Application Note AN-1112 *DSBGA Wafer Level Chip Scale Package (SNVA009)*. For best results during assembly, alignment ordinals on the PC board may be used to facilitate placement of the DSBGA device.

## 12 Device and Documentation Support

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

- (3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

  - C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
  - D. Falls within JEDEC MO-178 Variation AA.

DBV (R-PDSO-G5)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
  - D. Publication IPC-7351 is recommended for alternate designs.
  - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
