

# LCD Bias With Integrated Gamma Reference for Notebook PCs, Tablet PCs and Monitors

Check for Samples: [TPS65642A](#)

## 1 Introduction

### 1.1 Features

- 2.6 V to 6 V Input Voltage Range
- Synchronous Boost Converter ( $AV_{DD}$ )
- Non-Synchronous Boost Converter With Temperature Compensation ( $V_{GH}$ )
- Synchronous Buck Converter ( $V_{CORE}$ )
- Synchronous Buck Converter ( $V_{IO1}$ )
- Low Dropout Linear Regulator ( $V_{IO2}$ )
- Programmable  $V_{COM}$  Calibrator With Two Integrated Buffer Amplifiers
- Gate Voltage Shaping
- Panel Discharge Signal ( $\overline{XAO}$ )
- System Reset Signal ( $\overline{RST}$ )
- 14-Channel, 10-Bit Programmable Gamma Voltage Correction
- On-Chip EEPROM with Write Protect
- I<sup>2</sup>C™ Interface
- Thermal Shutdown
- Supports GIP and Non-GIP Displays
- 56-Ball, 3,16-mm × 3,45-mm 0,4-mm Pitch DSBGA

### 1.2 Applications

- Notebook PCs
- Tablet PCs
- Monitors

### 1.3 Description

The TPS65642A device is a compact LCD bias solution primarily intended for use in notebook and tablet PCs. The device comprises two boost converters to supply the source driver and gate driver, or level shifter, of the LCD panel; two buck converters and a low-dropout (LDO) linear regulator to supply the system logic voltages; a programmable  $V_{COM}$  generator with two high-speed amplifiers; 14-channel gamma-voltage correction; and a gate-voltage shaping function.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Excel is a registered trademark of Microsoft Corporation.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Copyright © 2013, Texas Instruments Incorporated

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## 2 Electrical Specifications

### 2.1 ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Pin voltage	VIN, SW2, VCORE, SW3, VIO1, VIO2 RSET, COMP, SCL, SDA, EN, FLK, WP, TCOMP, XAO, RST	−0.3	7	V
	AVDD, SW1, OUT1, OUT2, OUTA-OUTN	−0.3	12	V
	SW4	−0.3	36 <sup>(2)</sup>	V
	POS1, NEG1, POS2, NEG2	−0.3	12 <sup>(3)</sup>	V
	POS1-NEG1  <sup>(4)</sup> ,  POS2-NEG2  <sup>(4)</sup>		2	V
	VGH, VGHM, RE	−0.3	40 <sup>(5)</sup>	V
ESD Rating	Human Body Model		2000	V
	Machine Model		200	V
	Charged Device Model		700	V
T <sub>A</sub>	Ambient temperature	−40	85	°C
T <sub>J</sub>	Junction temperature	−40	150	°C
T <sub>STG</sub>	Storage temperature	−65	150	°C
	Lead temperature (soldering, 10 seconds)		300	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) V<sub>GH</sub> supplies up to 40 V can be generated, but require an external cascode transistor or charge pump.
- (3) For supply voltages less than 12 V, the absolute maximum input voltage is equal to the supply voltage.
- (4) Differential input voltage.
- (5) The combination of low temperatures and high V<sub>GH</sub> voltages can cause increased leakage current through the RE pin. In GIP applications that do not use the gate-voltage shaping function it is recommended to leave the RE pin open to minimize this effect.

### 2.2 THERMAL INFORMATION<sup>(1)</sup>

THERMAL METRIC		TPS65642A	UNIT
		YFF	
		56 PINS	
θ <sub>JA</sub>	Junction-to-ambient thermal resistance	45	°C/W
θ <sub>JCtop</sub>	Junction-to-case (top) thermal resistance	0.2	
θ <sub>JB</sub>	Junction-to-board thermal resistance	6.4	
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.8	
ψ <sub>JB</sub>	Junction-to-board characterization parameter	6.1	
θ <sub>JCbot</sub>	Junction-to-case (bottom) thermal resistance	N/A	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

### 2.3 RECOMMENDED OPERATING CONDITIONS

		MIN	TYP	MAX	UNIT
V <sub>IN</sub>	Input voltage range	2.6		6	V
<b>BOOST CONVERTER 1</b>					
AV <sub>DD</sub>	Boost converter 1 output voltage range	7		10.1	V
IAV <sub>DD</sub>	Boost converter 1 output current when 6 V ≥ V <sub>IN</sub> ≥ 4 V			700 <sup>(1)</sup>	mA
	Boost converter 1 output current when 3.63 V ≥ V <sub>IN</sub> ≥ 2.64 V			400 <sup>(1)</sup>	mA

- (1) This figure includes the current that must be supplied to the input of boost converter 2.

**RECOMMENDED OPERATING CONDITIONS (continued)**

		MIN	TYP	MAX	UNIT
L	Boost converter 1 inductor range	2.2	4.7	10	μH
C <sub>OUT</sub>	Boost converter 1 output capacitance	10			μF
<b>BOOST CONVERTER 2</b>					
AV <sub>DD</sub>	Input voltage range	7	8.4	10.1 <sup>(2)</sup>	V
V <sub>GH</sub>	Output voltage range	16	24	40 <sup>(3)</sup>	V
I <sub>GH</sub>	Output current		15	40	mA
L	Inductor	10	15		μH
C <sub>OUT</sub>	Output capacitance	1	4.7		μF
R <sub>NTC</sub>	Thermistor resistance at 25°C		10		kΩ
<b>BUCK CONVERTER 1 (V<sub>CORE</sub>)</b>					
V <sub>CORE</sub>	Output voltage	1	1.1	1.3	V
I <sub>CORE</sub>	Output current			600	mA
L	Inductor	1	2.2	4.7	μH
C <sub>OUT</sub>	Output capacitance	4.7	10	22	μF
<b>BUCK CONVERTER 2 (V<sub>IO1</sub>)</b>					
V <sub>IO1</sub>	Output voltage	1.7		2.5	V
I <sub>IO1</sub>	Output current			200 <sup>(4)</sup>	mA
L	Inductor	1	2.2	4.7	μH
C <sub>OUT</sub>	Output capacitance	4.7	10	22	μF
<b>LDO Regulator (V<sub>IO2</sub>)</b>					
V <sub>IO2</sub>	Output voltage	1.7		1.8	V
I <sub>IO</sub>	Output current			200	mA
C <sub>OUT</sub>	Output capacitance		4.7	10	μF
<b>PROGRAMMABLE VCOM</b>					
I <sub>SET</sub>	Programmable V <sub>COM</sub> set current		50		μA
<b>PROGRAMMABLE GAMMA CORRECTION</b>					
I <sub>GAM</sub>	Output current per channel	-100		100	μA
C <sub>GAM</sub>	Output capacitance			50	pF

(2) V<sub>GH</sub> - AV<sub>DD</sub> must be greater than 9 V.

(3) Output voltages greater than 36 V require an external cascode transistor.

(4) This figure includes the current supplied to the input of the linear regulator.

**2.4 ELECTRICAL CHARACTERISTICS**

V<sub>IN</sub> = 3.3 V, V<sub>CORE</sub> = 1.1 V, V<sub>IO1</sub> = 1.7 V, V<sub>IO2</sub> = 1.8 V<sup>(1)</sup>, AV<sub>DD</sub> = 8.4 V, V<sub>GH</sub> = 24 V, T<sub>A</sub> = -40°C to 85°C. Typical values are at 25°C (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY						
I <sub>IN</sub>	Supply current into VIN pins	Converters not switching	1.9	3		mA
	Supply current into AVDD pins	Pin G5.	0.1	1		mA
		Pin B7. No load on gamma reference outputs	4.3	6		
		Pin F4. No load on op-amp outputs	4.0	7.5		
	Supply current into VGH	No load on VGHM	0.1	1		mA
UNDERVOLTAGE LOCKOUT						
V <sub>UVLO</sub>	Undervoltage lockout threshold	V <sub>IN</sub> rising	2.3	2.42	2.5	V
		V <sub>IN</sub> falling	2.1	2.19	2.4	
	Hysteresis		0.23			

(1) When V<sub>IO1</sub> = 1.7 V or 1.8 V, the LDO regulator is disabled. When V<sub>IO1</sub> = 2.5 V, the LDO regulator is enabled.

**ELECTRICAL CHARACTERISTICS (continued)**

$V_{IN} = 3.3\text{ V}$ ,  $V_{CORE} = 1.1\text{ V}$ ,  $V_{IO1} = 1.7\text{ V}$ ,  $V_{IO2} = 1.8\text{ V}^{(1)}$ ,  $AV_{DD} = 8.4\text{ V}$ ,  $V_{GH} = 24\text{ V}$ ,  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$ . Typical values are at  $25^\circ\text{C}$  (unless otherwise noted).

**Table 3-1. PIN DESCRIPTIONS**

PIN		I/O	DESCRIPTION
NAME	NO.		
GND	A1	P	Ground
SW2	A2	O	Buck converter 1 ( $V_{CORE}$ ) switch pin
VIN	A3	P	Supply voltage
SW3	A4	O	Buck converter 2 ( $V_{IO1}$ ) switch pin
GND	A5	P	Ground
GND	A7	P	Ground
VIO2	A6	O	Linear regulator ( $V_{IO2}$ ) output and output sense
VCORE	B1	I	Buck converter 1 ( $V_{CORE}$ ) output sense
TCOMP	B2	I	Boost converter 2 ( $V_{GH}$ ) thermistor network connection
VIN	B3	P	Supply voltage
$\overline{XAO}$	B4	O	Panel discharge
$\overline{RST}$	B5	O	System reset
VIO1	B6	I	Buck converter 2 ( $V_{IO1}$ ) output sense. (Internally connected as supply voltage for LDO regulator.)
AVDD	B7	I	Boost converter 1 ( $AV_{DD}$ ) output sense. (Internally connected as supply voltage for programmable gamma correction.)
FLK	C1	I	Gate voltage shaping flicker clock
GND	C2	P	Ground
OUTL	C3	O	Gamma correction

**Table 3-1. PIN DESCRIPTIONS (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
OUTI	C4	O	Gamma correction
OUTE	C5	O	Gamma correction
OUTA	C6	O	Gamma correction
RSET	C7	O	Reference current-setting resistor connection
RE	D1	O	Gate voltage shaping discharge resistor connection
SDA	D2	I/O	I <sup>2</sup> C serial data
OUTM	D3	O	Gamma correction
OUTJ	D4	O	Gamma correction
OUTF	D5	O	Gamma correction
OUTB	D6	O	Gamma correction
POS1	D7	I	V <sub>COM1</sub> non-inverting input
VGHM	E1	O	Gate voltage shaping output
SCL	E2	I/O	I <sup>2</sup> C serial clock
OUTN	E3	O	Gamma correction
OUTK	E4	O	Gamma correction
OUTG	E5	O	Gamma correction
OUTC	E6	O	Gamma correction
POS2	E7	I	V <sub>COM2</sub> non-inverting input.
VGH	F1	I	Boost converter 2 (V <sub>GH</sub> ) output sense. (Internally connected as supply voltage for the gate voltage shaping.)
COMP	F2	O	Boost converter 1 (AV <sub>DD</sub> ) compensation network connection
WP	F3	I	EEPROM write protect
AVDD	F4	I	V <sub>COM1</sub> and V <sub>COM2</sub> supply voltage
OUTH	F5	O	Gamma correction
OUTD	F6	O	Gamma correction
NEG1	F7	I	V <sub>COM1</sub> inverting input
GND	G1	P	Ground.
EN	G2	I	Boost converter 1 (AV <sub>DD</sub> ) enable
GND	G3	P	Ground.
SW1	G4	O	Boost converter 1 (AV <sub>DD</sub> ) switch pin
AVDD	G5	O	Boost converter 1 (AV <sub>DD</sub> ) rectifier output
OUT1	G6	O	V <sub>COM1</sub> output
GND	G7	P	Ground.
SW4	H1	O	Boost converter 2 (V <sub>GH</sub> ) switch pin
GND	H2	P	Ground
GND	H3	P	Ground
SW1	H4	O	Boost converter 1 (AV <sub>DD</sub> ) switch pin
AVDD	H5	O	Boost converter 1 (AV <sub>DD</sub> ) rectifier output
OUT2	H6	O	V <sub>COM2</sub> output
NEG2	H7	I	V <sub>COM2</sub> inverting input

## 4 Typical Characteristics

### 4.1 Table of Graphs

## 5 Detailed Description

Figure 5-1 shows an internal block diagram of the TPS65642A device.

**Figure 5-1. Internal Block Diagram**

## 5.1 BOOST CONVERTER 1 ( $AV_{DD}$ )

Boost converter 1 is synchronous and uses a virtual current mode topology that:

- Achieves high efficiencies
- Allows the converter to work in continuous-conduction mode under all operating conditions, which simplifies compensation
- Provides a better drive signal for the negative charge pump connected to the switch node (because the converter always runs in continuous-conduction mode, even at low output currents)
- Provides true input-output isolation when the boost converter is disabled

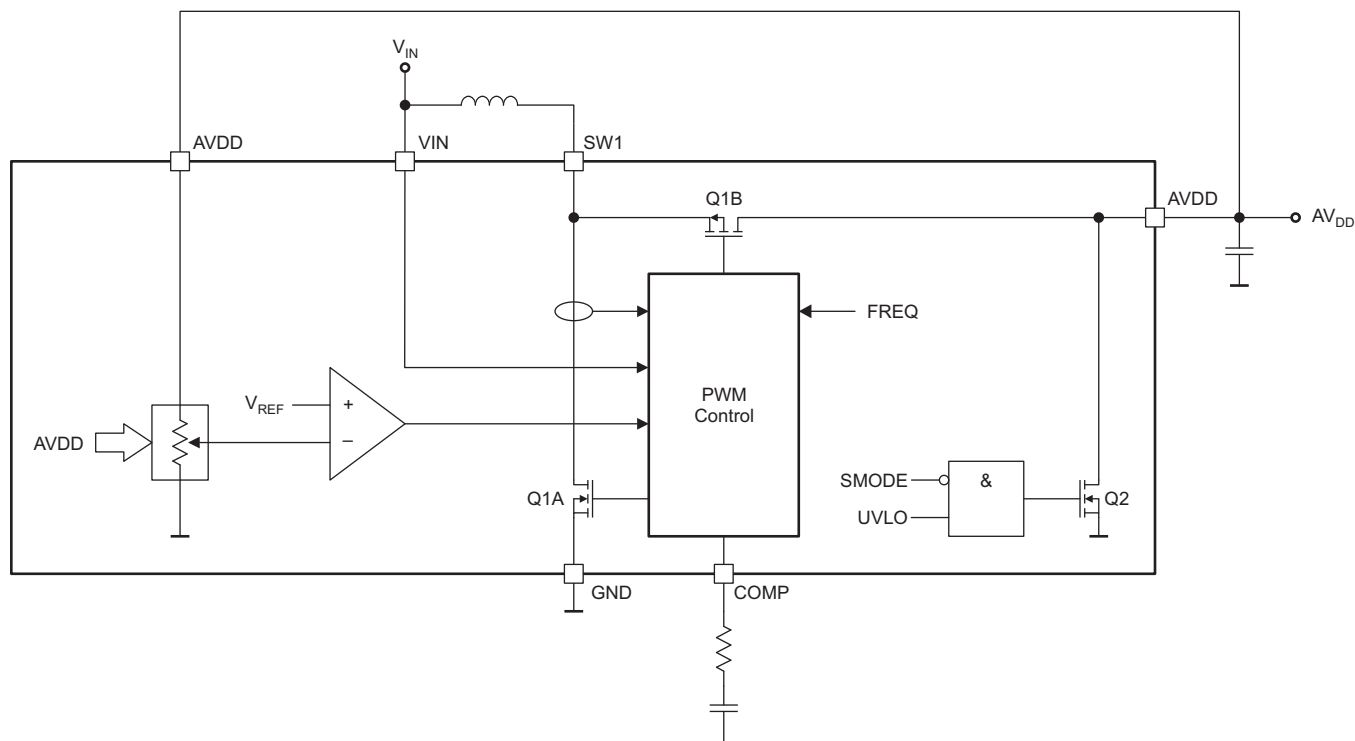

Figure 5-2. Boost Converter 1 Internal Block Diagram

### 5.1.1 Switching Frequency (Boost Converter 1)

The nominal switching frequency of boost converter 1 can be programmed to 750 kHz or 1200 kHz using the FREQ bit in the MISC register. The factory default value is 1200 kHz.

### 5.1.2 Compensation (Boost Converter 1)

Boost converter 1 uses an external compensation network connected to the COMP pin to stabilize its feedback loop. A simple series R-C network connected between the COMP pin and ground is sufficient to achieve good performance, in effect, stable and with good transient response. Good starting values, which will work for most applications, are 100 k $\Omega$  and 1 nF for 1200 MHz  $AV_{DD}$  switching frequency and 56 k $\Omega$  and 1.5 nF for 750 kHz  $AV_{DD}$  switching frequency.

In some applications (for example, those using electrolytic output capacitors), it may be necessary to include a second compensation capacitor between the COMP pin and ground. This has the effect of adding an additional pole in the frequency response of the feedback loop, which cancels the zero introduced by the ESR of the output capacitor.

The COMP pin is directly connected to the input current comparator of the converter, which means that any noise present on this pin can directly affect converter operation. In practical applications the most likely source of noise is the switch pin on the converter, and for proper operation it is essential that the stray capacitance between the SW1 and the COMP pins is minimized. This can be ensured using good PCB layout practices, namely:

- Locating the compensation components close to the COMP pin
- Removing the GND plane from underneath the SW1 PCB tracks (to prevent this high dV/dt signal from inducing currents locally in the GND plane)
- Connecting the ground side of the compensation components to a noise-free GND location, in effect, away from noisy power ground signals

---

#### NOTE

For the most robust operation TI recommends to ensure that the parasitic capacitance between the SW1 and COMP is below 0.1 pF.

---

### 5.1.3 Power Up (Boost Converter 1)

Boost converter 1 starts  $t_{DLY1}$  milliseconds after EN or  $\overline{RST}$  goes high, whichever occurs later. Delay time  $t_{DLY1}$  can be programmed from 0 ms to 70 ms using the DLY1 register. Once asserted, the EN signal must remain high to ensure normal device operation. Once disabled (EN = 0), boost converter 1 remains disabled until the device is powered down (even if EN is re-asserted).

To minimize inrush current during start-up, boost converter 1 ramps its output voltage in  $t_{SS2}$  milliseconds. Start-up time  $t_{SS2}$  can be programmed from 4 ms to 7.5 ms using the SS2 register. Longer soft-start times generate lower inrush currents.

The same ramp rate is also used for boost converter 2 – changing the SS2 register affects both boost converters.

The soft-start function is not implemented if the output voltage of boost converter 1 is re-programmed during operation. During normal operation (when  $AV_{DD}$  remains constant) the non-implementation of soft-start is not a problem, however, it may cause problems during production if  $AV_{DD}$  is changed while the converter is enabled. Problems can occur under such conditions because, without a soft-start, the converter draws a high inrush current when the output voltage of the converter is changed. If the converter is supplied from a high-impedance source, this inrush current can, under certain circumstances, pull  $V_{IN}$  below the UVLO threshold, disabling the IC and interrupting the writing of the configuration parameters. Use one or more of the following recommendations to ensure trouble-free configuration during production:

- Program the configuration parameters before the IC is soldered to the PCB
- Supply the PCB with a voltage high enough to ensure that the voltage on the VIN pin remains above the UVLO threshold when the value of  $AV_{DD}$  is changed
- Ensure that the supply impedance is low enough to ensure that the voltage on the VIN pin remains above the UVLO threshold when the value of  $AV_{DD}$  is changed
- Disable boost converter 1 while the value of  $AV_{DD}$  is changed

### 5.1.4 Power Down (Boost Converter 1)

Boost converter 1 is disabled when EN = 0 or  $V_{IN} < V_{UVLO}$ . When disabled, boost converter 1 actively discharges  $AV_{DD}$  by turning on Q2. The active discharge feature is disabled by setting SMODE = 1 in the CONFIG register. Once disabled (EN = 0), boost converter 1 remains disabled until the device powers down (even if EN is re-asserted).

### 5.1.5 Isolation (Boost Converter 1)

The synchronous topology of boost converter 1 ensures that  $AV_{DD}$  is fully isolated from  $V_{IN}$  when the converter is disabled.

### 5.1.6 Output Voltage (Boost Converter 1)

The output voltage of boost converter 1 can be programmed from 7 V to 10.1 V in 100 mV steps using the AVDD register. The factory default setting is 8.4 V.

### 5.1.7 Input Supply Characteristics

Boost converter 1 exhibits a fast response with excellent line transient performance. Its fast reaction to changes in input voltage means that excessive input impedance can cause the converter to become unstable. This can happen, for example, if  $V_{IN}$  is supplied via an excessively long cable, in which case the parasitic inductance of the cable forms a resonant circuit with the input capacitance of the IC. The following guidelines help avoid such problems and ensure proper operation:

- Minimize supply cable inductance
- Minimize supply cable resistance
- Maximize input capacitance
- Avoid using ceramic types for the bulk input capacitance
  - Capacitors with higher ESR help to damp any tendency to ring on the part of the input cable

## 5.2 BUCK CONVERTER 1 ( $V_{CORE}$ )

Buck converter 1 is synchronous and uses a constant off-time topology that offers high efficiency, fast transient response, and constant ripple-current amplitude under all operating conditions. The output voltage  $V_{CORE}$  can be programmed by the user. The off-time of the converter is inversely proportional to the output voltage, and therefore is constant when the converter is in regulation. Thus, for a given  $V_{IN}$ , the converter operates at a constant frequency that changes temporarily when the converter reacts to load changes.

Figure 5-3. Buck Converter 1 Block Diagram

### 5.2.1 Output Voltage (Buck Converter 1)

The output voltage of buck converter 1 can be programmed from 1 V to 1.3 V in 100 mV steps. The factory default setting is 1.1 V.

### 5.2.2 Power Up (Buck Converter 1)

Buck converter 1 starts as soon as  $V_{IN} > V_{UVLO}$  (the same time buck converter 2 and LDO regulator starts).

To minimize inrush current during start-up, buck converter 1 ramps  $V_{CORE}$  from zero to the final value in  $t_{SS1}$  milliseconds. Soft-start time  $t_{SS1}$  can be programmed from 0.5 ms to 4 ms using the SS1 register.

The same ramp rate is used for buck converter 2 and the linear regulator. Changing SS1 affects all three regulators.

### 5.2.3 Power Down (Buck Converter 1)

Buck converter 1 is disabled when  $V_{IN} < V_{UVLO}$ . The output of buck converter 1 is not actively discharged.

## 5.3 BUCK CONVERTER 2 ( $V_{IO1}$ )

Buck converter 2 is a low-power synchronous-buck converter that in typical applications generates the I/O supply voltage for the timing controller and source drivers. Buck converter 2 is essentially the same as buck converter 1: the output voltage  $V_{IO1}$  can be programmed by the user, but the output is actively discharged during power-down.

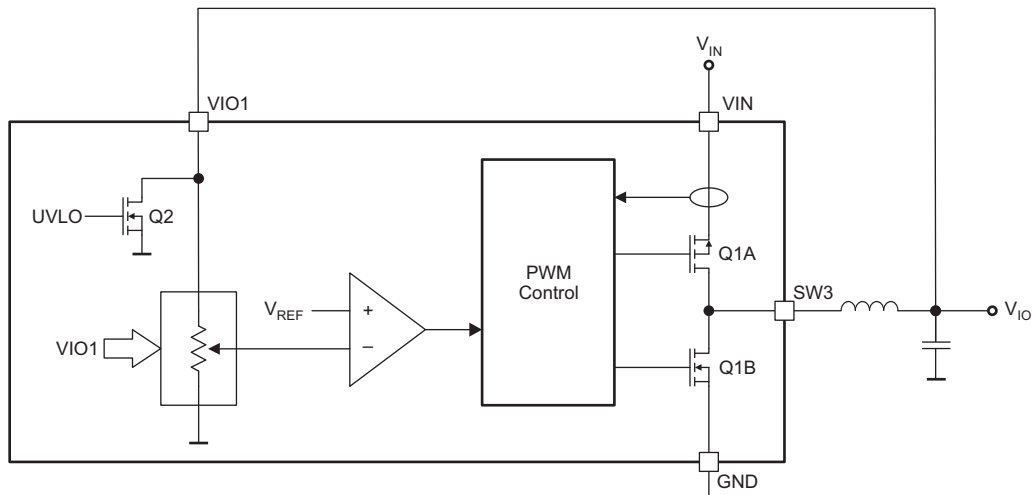

Figure 5-4. Buck Converter 2 Internal Block Diagram

### 5.3.1 Output Voltage (Buck Converter 2)

The output voltage of buck converter 2 can be programmed to 1.7 V, 1.8 V, or 2.5 V using the VIO register. The factory default setting is 1.7 V. When  $V_{IO1} = 1.7$  V or 1.8 V, the LDO regulator is disabled.

### 5.3.2 Power-Up (Buck Converter 2)

Buck converter 2 starts as soon as  $V_{IN} > V_{UVLO}$  (the same time buck converter 1 and LDO regulator starts), and implements the same voltage ramping as buck converter 1.

### 5.3.3 Power-Down (Buck Converter 2)

Buck converter 2 is disabled and actively discharges its output when  $V_{IN} < V_{UVLO}$ .

## 5.4 LDO REGULATOR ( $V_{IO2}$ )

In applications in which the timing controller and source drivers use different I/O voltages, the low-dropout (LDO) regulator can be used to generate the lower I/O supply voltage  $V_{IO2}$ . The LDO regulator is supplied from the VIO1 pin, which is the output of buck converter 2.

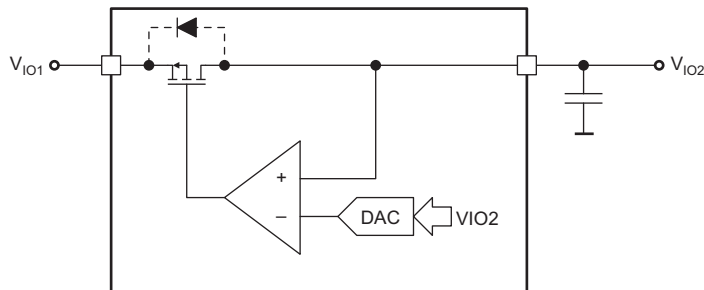

Figure 5-5. Linear Regulator Block Diagram

### 5.4.1 Output Voltage (LDO Regulator)

When  $V_{IO1} = 2.5$  V, the output voltage of the LDO regulator can be programmed to 1.7 V or 1.8 V using the VIO register. When  $V_{IO1} = 1.7$  V or 1.8 V, the LDO regulator is disabled (factory default setting). Once the device is powered up, the EN signal must remain high, to ensure reliable LDO programming.

### 5.4.2 Power-Up (LDO Regulator)

At power up, the LDO regulator starts as soon as  $V_{IN} > V_{UVLO}$  (the same time buck converter 1 and buck converter 2 starts). The LDO regulator ramps the output linearly from zero to  $V_{IO2}$  in  $t_{SS1}$  milliseconds. Soft-start time  $t_{SS1}$  can be programmed from 0.5 ms to 4 ms using the SS1 register.

The same ramp rate is used for both buck converters and the LDO regulator. Changing the SS1 register affects all three regulators.

When the LDO is turned on or turned off during normal device operation (that is: programming  $V_{IO1}$  from 1.7 V to 2.5 V or vice versa), the ramp or discharge characteristic is defined by the load connected to the LDO.

### 5.4.3 Power-Down (LDO Regulator)

The LDO regulator is supplied from the VIO1 pin, which is actively discharged during power-down. The output of the LDO regulator therefore discharges through the body diode of transistor Q1 as long as VIO2 is high enough to forward bias the body diode. Thereafter,  $V_{IO2}$  continues to discharge through the load connected to it.

## 5.5 BOOST CONVERTER 2 ( $V_{GH}$ )

Boost converter 2 is non-synchronous, and uses a constant off-time topology. The switching frequency of the converter is not constant, but automatically adjusts for best performance according to  $V_{IN}$  and  $V_{GH}$ . Boost converter 2 uses peak current control and is designed to operate permanently in discontinuous-conduction mode (DCM), thereby allowing the internal compensation circuit to achieve stable operation over a wide range of output voltages and currents, such as when temperature compensation is used.

Figure 5-6 shows a simplified block diagram of boost converter 2.

**Figure 5-6. Boost Converter 2 Block Diagram**

Boost converter 2 can be temperature compensated, allowing the output voltage to transition from a higher voltage at low temperatures  $V_{GH(COLD)}$  to a lower voltage at high temperatures  $V_{GH(HOT)}$  (see Figure 5-7 and Figure 5-8). The values of  $V_{GH(HOT)}$  and  $V_{GH(COLD)}$  are programmed using the VGHHOT and VGHCOLD registers. The values of  $T_{HOT}$  and  $T_{COLD}$  are programmed by selecting the appropriate resistor values for the thermistor network connected to the TCOMP pin.

**Figure 5-7. Boost Converter 2 Temperature Compensation Characteristic**

**Figure 5-8. Boost Converter 2 Temperature Compensation Block Diagram**

With proper selection of the external components  $R_{T1}$ ,  $R_{T2}$  and  $R_{NTC}$ , temperatures  $T_{HOT}$  and  $T_{COLD}$  can be configured to suit the characteristics of each display. A Microsoft Excel® spreadsheet allowing easy calculation of component values is available from Texas Instruments free of charge.

### 5.5.1 Power-Up (Boost Converter 2)

When  $AV_{DD}$  is finished ramping up, boost converter 2 enables. To minimize inrush current during start-up, boost converter 2 ramps  $V_{GH}$  linearly to the programmed value in  $t_{SS2}$  seconds. Soft-start time  $t_{SS2}$  can be programmed from 4 ms to 7.5 ms using the SS2 register. The same ramp rate is also used for boost converter 1. Changing SS2 affects both boost converters.

### 5.5.2 Power-Down (Boost Converter 2)

Boost converter 2 is disabled when  $EN = 0$  or  $V_{IN} < V_{UVLO}$ . The output of the converter is not actively discharged when the converter is disabled. Once disabled ( $EN = 0$ ), boost converter 2 remains disabled until the device is powered down (even if  $EN$  is re-asserted).

### 5.5.3 Setting the Output Voltage (Boost Converter 2)

The output voltage of boost converter 2 at cold temperatures can be programmed from 25 V to 40 V <sup>(1)</sup> using the VGHCOLD register. The output voltage of boost converter 2 at hot temperatures can be programmed from 16 V to 31 V using the VGHHOT register.

In applications that do not require temperature compensation, the TCOMP pin must be tied to ground and the VGHHOT register must set the voltage of  $V_{GH}$ .

See [Figure 5-8](#) and note that between  $V_{GHHOT}$  and  $V_{GHCOLD}$ , the output voltage of boost converter 2 is given by [Equation 1](#).

$$V_{GH} = 28 \times (V_{DAC2} + 3 \times (V_{TCOMP} - V_{DAC2})) \quad (1)$$

[Equation 1](#) calculates the voltage required on the TCOMP pin at temperatures  $T_{HOT}$  and  $T_{COLD}$ .

$$V_{TCOMP_{HOT}} = \frac{V_{GHHOT}}{28} \quad (2)$$

$$V_{TCOMP_{COLD}} = \frac{2 \times V_{GHHOT} + V_{GHCOLD}}{84} \quad (3)$$

(1) Output voltages greater than 36 V require an external cascode transistor.

Equation 4 calculates the appropriate value for  $R_{T2}$

$$R_{T2} = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

where

$$\begin{aligned} \bullet \quad a &= R_{NTCCOLD} - R_{NTCHOT} - \frac{V_{TCOMP COLD} - V_{TCOMP HOT}}{I_{SET}} \\ \bullet \quad b &= (R_{NTCCOLD} + R_{NTCHOT}) \times \left( \frac{V_{TCOMP COLD} - V_{TCOMP HOT}}{I_{SET}} \right) \\ \bullet \quad c &= (R_{NTCCOLD} \times R_{NTCHOT}) \times \left( \frac{V_{TCOMP COLD} - V_{TCOMP HOT}}{I_{SET}} \right) \\ \bullet \quad R_{NTCCOLD} &\text{ is the resistance of the thermistor at temperature } T_{COLD} \\ \bullet \quad R_{NTCHOT} &\text{ is the resistance of the thermistor at temperature } T_{HOT} \end{aligned} \quad (4)$$

Once the value of  $R_{T2}$  has been calculated, use Equation 5 to calculate the appropriate value of  $R_{T1}$ .

$$R_{RT1} = \times \left( \frac{V_{TCOMP COLD}}{I_{SET}} \right) - \left( \frac{R_{NTCCOLD} \times R_{T2}}{R_{NTCCOLD} + R_{T2}} \right) \quad (5)$$

#### 5.5.4 Protection ( $AV_{DD}$ , $V_{CORE}$ , $V_{IO1}$ , $V_{IO2}$ , $V_{GH}$ )

Each voltage regulator is protected against short-circuits and undervoltage conditions. An undervoltage condition is detected if a regulator output falls below 70% of the programmed voltage for longer than 50 ms, in which case the IC is disabled. To recover normal operation following an undervoltage condition, the cause of the error condition must be removed and the supply voltage,  $V_{IN}$ , must be cycled. A short-circuit condition is detected if a regulator output falls below 30% of its programmed voltage, in which case the IC is disabled immediately. To recover normal operation following a short-circuit condition, the cause of the error must be removed and the supply voltage,  $V_{IN}$ , must be cycled.

## 5.6 RESET GENERATOR

The  $\overline{RST}$  pin generates an active-low reset signal for the timing controller. During power up, the reset timer starts when  $V_{CORE}$  has finished ramping. The reset pulse duration  $t_{RESET}$  can be programmed from 2 ms to 16 ms using the RESET register. The  $\overline{RST}$  signal is latched when it goes high and is not taken low again until the device is powered down (even if  $V_{CORE}$  temporarily falls out of regulation). The active power-down threshold ( $V_{UVLO}$  or  $V_{DET}$ ) can be selected using the RMODE bit in the CONFIG register.

The  $\overline{RST}$  output is an open-drain type that requires an external pullup resistor. Pullup-resistor values in the range 10 k $\Omega$  to 100 k $\Omega$  are recommended for most applications.

## 5.7 GATE VOLTAGE SHAPING

The gate-voltage shaping function reduces image sticking in LCD panels by modulating the gate ON voltage ( $V_{GH}$ ) of the LCD panel. Figure 5-9 shows a block diagram of the gate voltage shaping function and Figure 5-10 shows the typical waveforms during operation.

Figure 5-9. Gate-Voltage Shaping Block Diagram

Figure 5-10. Gate-Voltage Shaping Waveforms

Gate-voltage shaping is controlled by the FLK input. When FLK is high, Q1 is on, Q2 is off, and  $V_{GHM}$  is equal to  $V_{GH}$ . When FLK is low, Q1 is turned off, Q2 is turned on, and the LCD-panel load connected to the V\_GHM pin discharges through the external resistor connected to the RE pin. This resistor is typically connected to GND or  $AV_{DD}$ .

During power-up Q2 is held permanently on and Q1 permanently off, regardless of the state of the FLK signal, until  $t_{DLY6}$  milliseconds after boost converter 2 ( $V_{GH}$ ) has finished ramping. The value of  $t_{DLY6}$  can be programmed from 0 ms to 35 ms using the DLY6 register.

During power-down Q1 is held permanently on and Q2 permanently off, regardless of the state of the FLK signal.

Non-GIP or Non-ASG panels that do not use the gate-voltage shaping function must leave the RE pin floating and connect the FLK pin to GND.

## 5.8 PANEL RESET / LCD BIAS READY ( $\overline{\text{XAO}}$ )

The TPS65642A device provides an output signal through the  $\overline{\text{XAO}}$  pin that is used to reset a level-shifter or gate-driver IC during power up and power down. The GIP bit in the CONFIG register defines whether the  $\overline{\text{XAO}}$  pin works in GIP mode or non-GIP mode.

The primary purpose of the  $\overline{\text{XAO}}$  signal in non-GIP applications is to drive the outputs of the display-panel gate-driver IC high during power down by generating an active-low signal. When the GIP = 0, the  $\overline{\text{XAO}}$  pin is pulled low whenever  $V_{\text{IN}} < V_{\text{DET}}$ . The  $V_{\text{DET}}$  threshold voltage can be configured using the VDET register.

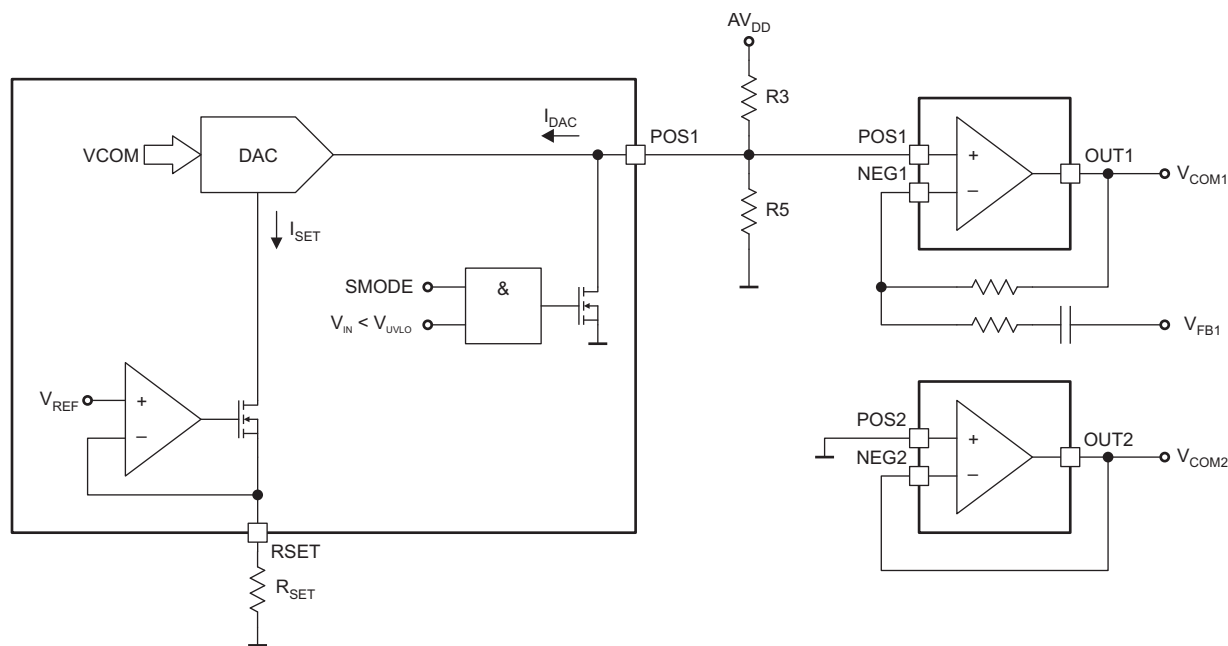

When the GIP = 1, the  $\overline{\text{XAO}}$  output is used to delay the start of level-shifter activity during power up. The delay time  $t_{\text{DLY6}}$  starts when  $V_{\text{GH}}$  is done ramping up, and can be configured using the DLY6 register.

The  $\overline{\text{XAO}}$  output is an open-drain type and requires an external pull up, typically in the range 10 k $\Omega$  to 100 k $\Omega$ .

## 5.9 PROGRAMMABLE $V_{\text{COM}}$ CALIBRATOR

The programmable  $V_{\text{COM}}$  calibrator uses a digital-to-analog converter (DAC) to generate an offset current  $I_{\text{DAC}}$  for an external resistor divider connected to  $\text{AV}_{\text{DD}}$  (see Figure 5-11 and Figure 5-12). Higher values of the 7-bit digital word N written to the DAC generate higher  $I_{\text{DAC}}$  sink currents, and therefore lower  $V_{\text{COM}}$  voltages.

Figure 5-11 shows the recommended circuit for the most commonly used application, when the LCD panel requires only one  $V_{\text{COM}}$  supply voltage. The second op-amp is shown wired as a unity-gain buffer with an input tied to GND (the recommended configuration if a second op-amp is not used), however, using a second op-amp for other purposes, such as generating a half- $\text{AV}_{\text{DD}}$  supply rail, is acceptable.

**Figure 5-11. Single-Programmable  $V_{\text{COM}}$  Supply**

The external resistor  $R_{SET}$  generates a reference current  $I_{SET}$  for the DAC. Since this reference current is also used by the temperature compensation function of boost converter 2, care must be taken to ensure that a suitable value is chosen. For most applications, a value of 24.9 k $\Omega$  is recommended, which generates a reference current given by Equation 6.

$$I_{SET} = \frac{V_{REF}}{R_{SET}}$$

$$I_{SET} = \frac{1.25V}{24.9k\Omega} = 50.2\mu A \quad (6)$$

The output current  $I_{DAC}$  sunk by the DAC is given by Equation 7.

$$I_{DAC} = \frac{(N+1) \times I_{SET}}{128}$$

where

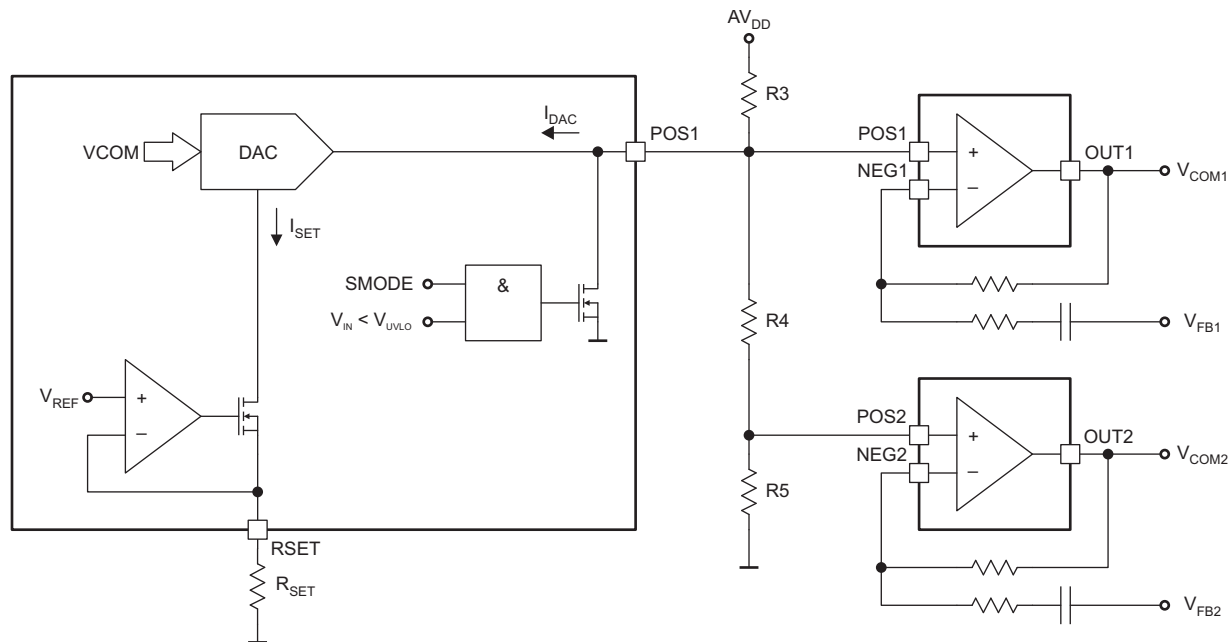

- N is the 7-bit word written to the DAC, and ranges from 0 to 127 (7)

Equation 8 and Equation 9 can calculate appropriate values for R3 and R5.

$$R3 = \frac{128 \times \Delta V_{COM} \times AV_{DD}}{I_{SET} \times (127 \times V_{COM(MAX)} + \Delta V_{COM})} \quad (8)$$

$$R5 = \frac{128 \times \Delta V_{COM} \times R3}{(127 \times I_{SET} \times R3) - (128 \times \Delta V_{COM})} \quad (9)$$

Figure 5-12 shows the recommended connection for the case when two  $V_{COM}$  supplies  $V_{COM1}$  and  $V_{COM2}$  are to be generated.

**Figure 5-12. Dual-Programmable  $V_{COM}$  Supplies**

In Figure 5-12, the voltage  $V_{COM2}$  generated by the second op-amp is slightly lower than  $V_{COM1}$ . If two identical  $V_{COM}$  supplies are required, these can be generated by setting  $R4 = 0$ .

Equation 10 through Equation 12 calculate the correct values for R3 through R5 for the case when two (slightly different)  $V_{COM}$  voltages are required.

$$R3 = \frac{128 \times \Delta V_{COM} \times AV_{DD}}{I_{SET} \times (127 \times V_{COM1(MAX)} + \Delta V_{COM})} \quad (10)$$

$$R4 = \left( \frac{V_{COM2(MAX)}}{V_{COM1(MAX)}} \right) \times \left( \frac{128 \times \Delta V_{COM} \times R3}{(127 \times I_{SET} \times R3) - (128 \times \Delta V_{COM})} \right) \quad (11)$$

$$R5 = \left( \frac{V_{COM1(MAX)} - V_{COM2(MAX)}}{V_{COM1(MAX)}} \right) \times \left( \frac{128 \times \Delta V_{COM} \times R3}{(127 \times I_{SET} \times R3) - (128 \times \Delta V_{COM})} \right) \quad (12)$$

A Microsoft Excel spreadsheet is available free of charge that calculates the values of R3, R4 and R5 — contact a local TI sales representative for a copy.

### 5.9.1 Operational Amplifier Performance

Like most operation amplifiers (op amps), the  $V_{COM}$  op amps are not designed to drive purely capacitive loads, so TI does not recommend to connect a capacitor directly to the outputs of the op amps in an attempt to increase performance; however, the amplifiers are capable of delivering high peak currents that make such capacitors unnecessary.

High-speed op amps such as those in the TPS65642A device require care when using them. The most common problem is when parasitic capacitance at the inverting input creates a pole with the feedback resistor, reducing amplifier stability. Two things can minimize the likelihood of this happening which work by shifting the pole (which can never be completely eliminated) to a frequency outside the bandwidth of the op amp, where it has no effect.

1. Reduce the value of the feedback resistor. In applications where no feedback from the panel is used, the feedback resistor can be made zero. In applications where a non-zero feedback resistor has to be used, a small capacitor (10 pF – 100 pF) across the feedback resistor will minimize ringing.
2. Minimize the parasitic capacitance at the op amp's inverting input. This is achieved by using short PCB traces between the feedback resistor and the inverting input, and by removing ground planes and other copper areas above and below this PCB trace.

### 5.9.2 Power Up (Programmable VCOM)

The programmable  $V_{COM}$  is enabled when  $AV_{DD} > \approx 3 \text{ V}$ .

### 5.9.3 Power Down (Programmable VCOM)

The programmable  $V_{COM}$  supports two kinds of power-down behavior, and the SMODE bit in the CONFIG register determines which behavior is active (see Figure 5-41 and Figure 5-42).

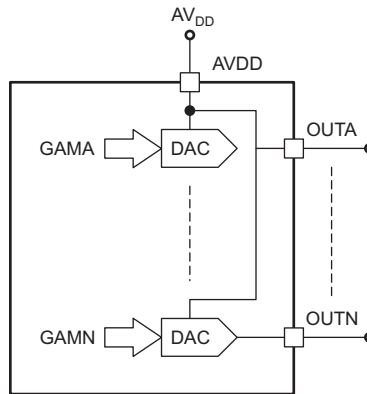

If SMODE = 0, the active discharge transistor Q1 is permanently disabled; during power-down,  $V_{COM}$  tracks  $AV_{DD}$  until  $V_{COM}$  is too low to support operation. If SMODE = 1, Q1 turns on when  $V_{IN} < V_{UVLO}$ , actively pulling  $V_{COM}$  low.

## 5.10 PROGRAMMABLE GAMMA-VOLTAGE GENERATOR

The gamma-voltage correction supplies 14 reference voltages that can be used by the system source driver IC to match the LCD-panel luminance characteristics more closely to the response of the human eye.

The gamma-correction voltages can be programmed individually using the I<sup>2</sup>C interface. During power up, the default gamma voltage for each channel is loaded from EEPROM into the corresponding DAC.

During operation, the output voltages of the DAC can be changed by programming new values via the I<sup>2</sup>C interface. Values programmed to the DACs but not transferred to EEPROM are lost when power is removed from the device. The next time the device is powered up, the DACs are programmed with whatever values are stored in the EEPROM. The current DAC settings can be transferred to EEPROM (thereby becoming the new default values used during power-up) at any time by sending the appropriate command to the Control Register through the I<sup>2</sup>C interface.

**Figure 5-13. Gamma Correction Block Diagram**

The output stages of the gamma correction block are capable of extending close to the supply rails (AV<sub>DD</sub> and ground); however, they can only achieve this rail-to-rail performance with the specified accuracy if the outputs are lightly loaded. The gamma reference outputs are only intended to drive high impedance loads such as those presented by a gamma buffer or a high impedance source driver input.

The output voltage V<sub>GAM</sub> of each channel is given by:

$$V_{GAM} = \frac{N}{1024} \cdot AV_{DD}$$

where

- N is the 10-bit digital word programmed to the gamma register and ranges from 0 to 1023 (13)

Any non-used output can be left open and, to save power, must be programmed to the maximum voltage (approximately 180-μA saving per output).

## 5.11 CONFIGURATION

The TPS65642A device divides the configuration parameters into two categories:

1. V<sub>COM</sub>
2. all other configuration parameters

In typical applications, all configuration parameters except V<sub>COM</sub> are programmed by the subcontractor during PCB assembly, and V<sub>COM</sub> is programmed by the display manufacturer during display calibration.

### 5.11.1 RAM, EEPROM, and Write Protect

Configuration parameters are changed by writing the desired values to the appropriate RAM register(s). The RAM registers are volatile and their contents are lost when power is removed from the device. By writing to the Control Register, storing the active configuration in non-volatile EEPROM is possible; during power up, the contents of the EEPROM are copied into the RAM registers and used to configure the device.

An active-high Write Protect (WP) pin prevents the configuration parameters from being changed by accident. This pin is internally pulled high and must be actively pulled low to access to the EEPROM or RAM registers. Note that the WP pin disables all I<sup>2</sup>C traffic to and from the TPS65642A device, and must also be pulled low during read operations. This is to ensure that noise present on the I<sup>2</sup>C lines does not erroneously overwrite the active configuration stored in RAM (which would not be protected by a simple EEPROM write-protect scheme).

### 5.11.2 Configuration Parameters (Excluding VCOM)

Table 5-1 shows the memory map of the configuration parameters.

**Table 5-1. Configuration Memory Map**

REGISTER ADDRESS	REGISTER NAME	FACTORY DEFAULT	DESCRIPTION
00h	CONFIG	00h	Sets miscellaneous configuration bits
01h	AVDD	0Eh	Sets the output voltage of boost converter 1
02h	VGHHOT	00h	Sets the output voltage of boost converter 2 at high temperatures
03h	VGHCOLD	00h	Sets the output voltage of boost converter 2 at low temperatures
04h	VIO	00h	Sets the output voltage of buck converter 2 and the LDO regulator
05h	MISC	05h	Sets the output voltage of buck converter 1 (V <sub>CORE</sub> ) and the switching frequency of boost converter 1 (AV <sub>DD</sub> )
06h	SS1	03h	Sets the soft-start time for buck converters 1 and 2 and the linear regulator
07h	SS2	00h	Sets the soft-start time for boost converters 1 and 2
08h	RESET	01h	Sets the reset pulse duration
09h	DLY1	02h	Sets the boost converter 1 start-up delay
0Ah	DLY6	04h	Sets the gate voltage shaping and LCD ready start-up delay
0Bh	VDET	00h	Sets the threshold of the /RST and /XAO signals
0Ch	GAMMA-A	02h	Contains the 2 MSBs of the 10-bit gamma voltage A

REGISTER ADDRESS	REGISTER NAME	FACTORY DEFAULT	DESCRIPTION
24h	GAMMA-M	02h	Contains the 2 MSBs of the 10-bit gamma voltage M
25h		00h	Contains the 8 LSBs of the 10-bit gamma voltage M
26h	GAMMA-N	02h	Contains the 2 MSBs of the 10-bit gamma voltage N
27h		00h	Contains the 8 LSBs of the 10-bit gamma voltage N
FFh	Control	00h	Controls whether read and write operations access RAM or EEPROM registers

### 5.11.3 CONFIG (00h)

**Figure 5-14. CONFIG Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented					RMODE	SMODE	GIP
					R/W-0	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-2. CONFIG Register Field Descriptions**

Bit	Field	Value	Description
7–3	Not implemented.	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
2	RMODE	0 1	Configures the $\overline{RST}$ power-down threshold voltage. <b>0</b> $V_{UVLO}$ threshold used. <b>1</b> $V_{DET}$ Threshold used.
1	SMODE	0 1	Configures the power-down behavior of $AV_{DD}$ and $V_{COM}$ . <b>0</b> $AV_{DD}$ is actively discharged (but not $V_{COM}$ ). <b>1</b> $V_{COM}$ is actively discharged (but not $AV_{DD}$ ).
0	GIP	0 1	This bit configures the device for use with either GIP or non-GIP LCD panels. <b>0</b> <b>The device operates in non-GIP mode, and XAO functions as a panel reset during power-down.</b> <b>1</b> The device operates in GIP mode, and the $\overline{XAO}$ functions as an enable for the panel level shifter

### 5.11.4 AVDD (01h)

**Figure 5-15. AVDD Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented			AVDD				
			R/W-0	R/W-1	R/W-1	R/W-1	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = **factory default**

**Table 5-3. AVDD Register Field Descriptions**

Bit	Field	Value	Description
7–4	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
4–0	AVDD		These bits configure boost converter 1's output voltage (AV <sub>DD</sub> ).
		00h	7.0 V
		01h	7.1 V
		02h	7.2 V
		03h	7.3 V
		04h	7.4 V
		05h	7.5 V
		06h	7.6 V
		07h	7.7 V
		08h	7.8 V
		09h	7.9 V
		0Ah	8.0 V
		0Bh	8.1 V
		0Ch	8.2 V
		0Dh	8.3 V
		<b>0Eh</b>	<b>8.4 V</b>
		0Fh	8.5 V
		10h	8.6 V
		11h	8.7 V
		12h	8.8 V
		13h	8.9 V
		14h	9.0 V
		15h	9.1 V
		16h	9.2 V
		17h	9.3 V
		18h	9.4 V
		19h	9.5 V
		1Ah	9.6 V
		1Bh	9.7 V
		1Ch	9.8 V
		1Dh	9.9 V
		1Eh	10.0 V
		1Fh	10.1 V

### 5.11.5 VGHHOT (02h)

**Figure 5-16. VGHHOT Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented				VGHHOT			
				R/W-0	R/W-0	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-4. VGHHOT Register Field Descriptions**

Bit	Field	Value	Description
7–4	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
3–0	VGHHOT	<b>0h 16 V</b> 1h 17 V 2h 18 V 3h 19 V 4h 20 V 5h 21 V 6h 22 V 7h 23 V 8h 24 V 9h 25 V Ah 26 V Bh 27 V Ch 28 V Dh 29 V Eh 30 V Fh 31 V	These bits configure boost converter 2's output voltage ( $V_{GH}$ ) of at high temperatures.

### 5.11.6 VGHCOLD (03h)

**Figure 5-17. VGHCOLD Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented				VGHCOLD			
				R/W-0	R/W-0	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-5. VGHCOLD Register Field Descriptions**

Bit	Field	Value	Description
7–4	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
3–0	VGHCOLD	<b>0h 25 V</b> 1h 26 V 2h 27 V 3h 28 V 4h 29 V 5h 30 V 6h 31 V 7h 32 V 8h 33 V 9h 34 V Ah 35 V Bh 36 V Ch 37 V Dh 38 V Eh 39 V Fh 40 V	These bits configure boost converter 2's output voltage ( $V_{GH}$ ) at low temperatures.

### 5.11.7 VIO (04h)

**Figure 5-18. VIO Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented						VIO	
						R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-6. VIO Register Field Descriptions**

Bit	Field	Value	Description
7–2	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
1–0	VIO	<b>0h</b> <b>V<sub>IO1</sub> = 1.7 V, LDO regulator disabled.</b> <b>1h</b> V <sub>IO1</sub> = 1.8 V, LDO regulator disabled. <b>2h</b> V <sub>IO1</sub> = 2.5 V, V <sub>IO2</sub> = 1.7 V. <b>3h</b> V <sub>IO1</sub> = 2.5 V, V <sub>IO2</sub> = 1.8 V.	These bits configure the output voltage of buck converter 2 (V <sub>IO1</sub> ) and the LDO regulator (V <sub>IO2</sub> ). Once the device is powered up, the EN signal must remain high, to ensure reliable LDO programming.

### 5.11.8 MISC (05h)

**Figure 5-19. MISC Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented					FREQ	VCORE	
					R/W-1	R/W-0	R/W-1

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-7. MISC Register Field Descriptions**

Bit	Field	Value	Description
7–3	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
2	FREQ	0h 1h	This bit configures boost converter 1's ( $AV_{DD}$ ) switching frequency. 750 kHz <b>1200 kHz</b>
1–0	VCORE	0h 1h 2h 3h	These bits configure buck converter 1's ( $V_{CORE}$ ) output voltage. 1 V <b>1.1 V</b> 1.2 V 1.3 V

### 5.11.9 SS1 (06h)

**Figure 5-20. SS1 Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented					SS1		
					R/W-0	R/W-1	R/W-1

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-8. SS1 Register Field Descriptions**

Bit	Field	Value	Description
7–3	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
2–0	SS1	0h 0.5 ms 1h 1 ms 2h 1.5 ms <b>3h 2 ms</b> 4h 2.5 ms 5h 3 ms 6h 3.5 ms 7h 4 ms	These bits configure the soft-start time for buck converter 1 ( $V_{CORE}$ ), buck converter 2 ( $V_{IO1}$ ) and the LDO linear regulator ( $V_{IO2}$ ).

### 5.11.10 SS2 (07h)

**Figure 5-21. SS2 Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented					SS2		
					R/W-0	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-9. SS2 Register Field Descriptions**

Bit	Field	Value	Description
7–3	Not Implemented	N/A 0 1	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
2–0	SS2	<b>0h</b> <b>4 ms</b> 1h    4.5 ms 2h    5 ms 3h    5.5 ms 4h    6 ms 5h    6.5 ms 6h    7 ms 7h    7.5 ms	These bits configure the soft-start time for boost converter 1 ( $AV_{DD}$ ) and boost converter 2 ( $V_{GH}$ ).

### 5.11.11 RESET (08h)

**Figure 5-22. RESET Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented						RESET	
						R/W-0	R/W-1

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-10. RESET Register Field Descriptions**

Bit	Field	Value	Description
7–2	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
1–0	RESET	0h 2 ms <b>1h 4 ms</b> 2h 8 ms 3h 16 ms	These bits configure the duration of the reset pulse during start-up.

### 5.11.12 DLY1 (09h)

**Figure 5-23. DLY1 Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented					DLY1		
					R/W-0	R/W-1	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-11. DLY1 Register Field Descriptions**

Bit	Field	Value	Description
7–3	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
2–0	DLY1	0h 0 ms 1h 10 ms <b>2h 20 ms</b> 3h 30 ms 4h 40 ms 5h 50 ms 6h 60 ms 7h 70 ms	These bits configure the start-up delay for boost converter 1 ( $AV_{DD}$ ).

### 5.11.13 DLY6 (0Ah)

**Figure 5-24. DLY6 Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented					DLY6		
					R/W-1	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-12. DLY6 Register Field Descriptions**

Bit	Field	Value	Description
7–3	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
2–0	DLY6	0h 1h 2h 3h <b>4h</b> 5h 6h 7h	These bits configure the delay between $V_{GH}$ reaching its final value and gate voltage shaping or $\overline{XAO}$ being enabled. 0 ms 5 ms 10 ms 15 ms <b>20 ms</b> 25 ms 30 ms 35 ms

### 5.11.14 VDET (0Bh)

**Figure 5-25. VDET Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented					VDET		
					R/W-0	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-13. VDET Register Field Descriptions**

Bit	Field	Value	Description
7–3	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
2–0	VDET	<b>0h</b> <b>2.2 V</b> 1h    2.3 V 2h    2.4 V 3h    2.5 V 4h    3.6 V 5h    3.7 V 6h    3.8 V 7h    3.9 V	These bits configure the threshold for $\overline{\text{XAO}}$ and $\overline{\text{RST}}$ (if RMODE is "1" in the CONFIG register).

### 5.11.15 GAMxHI (0Ch, 0Eh...26h)

**Figure 5-26. GAMxHI Register Bit Allocation**

7	6	5	4	3	2	1	0
Not Implemented						GAMxHI	
						R/W-1	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-14. GAMxHI Register Field Descriptions**

Bit	Field	Value	Description
7–2	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
1–0	GAMxHI	0h–3h	These bits form the two most significant bits of the 10-bit GAMx value used to program the gamma correction voltage for channel x.

### 5.11.16 GAMxLO (0Dh, 0Fh...27h)

**Figure 5-27. GAMxLO Register Bit Allocation**

7	6	5	4	3	2	1	0
GAMxLO							
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-15. GAMxLO Register Field Descriptions**

Bit	Field	Value	Description
7–0	GAMxLO	00h–FF h	These bits form the least significant eight bits of the 10-bit value used to program the gamma correction voltage for channel x.

### 5.11.17 Control (FFh)

**Figure 5-28. CONTROL Register Bit Allocation**

7	6	5	4	3	2	1	0
WED	Not Implemented						RED
R/W-0							R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-16. CONTROL Register Field Descriptions**

Bit	Field	Value	Description
7	WED	<p><b>0</b></p> <p><b>1</b></p>	<p>Setting this bit forces the contents of all DAC registers to be copied to the EEPROM, thereby making them the default values during power-up.</p> <p><b>Not used. This bit is automatically reset to 0 when the contents of the DAC registers have been copied to EEPROM.</b></p> <p>The contents of all DAC registers are copied to the EEPROM, making them the new default values following power-up.</p>
6–1	Not Implemented	N/A	These bits are not implemented in hardware. During write operations data for these bits is ignored, and during read operations 0 is returned.
0	RED	<p><b>0</b></p> <p><b>1</b></p>	<p>This bit configures the data returned by read operations.</p> <p><b>Read operations return the contents of the DAC registers.</b></p> <p>Read operations return the content of the EEPROM registers.</p>

### 5.11.18 Example – Writing to a Single RAM Register

1. Bus master sends START condition
2. Bus master sends 7-bit slave address plus low R/W bit (E8h)
3. TPS65642A acknowledges
4. Bus master sends address of RAM register (00h)
5. TPS65642A acknowledges
6. Bus master sends data to be written
7. TPS65642A acknowledges
8. Bus master sends STOP condition

**Figure 5-29. Writing to a Single RAM Register**

### 5.11.19 Example – Writing to Multiple RAM Registers

1. Bus master sends START condition
2. Bus master sends 7-bit slave address plus low R/W bit (E8h).
3. TPS65642A acknowledges
4. Bus master sends address of first RAM register to be written to (00h)
5. TPS65642A acknowledges
6. Bus master sends data to be written to first RAM register
7. TPS65642A acknowledges
8. Bus master sends data to be written to RAM register at next higher address (auto-increment)
9. TPS65642A acknowledges
10. Steps (8) and (9) repeated until data for final RAM register has been sent
11. TPS65642A acknowledges
12. Bus master sends STOP condition

**Figure 5-30. Writing to Multiple RAM Registers**

### 5.11.20 Example – Saving Contents of all RAM Registers to EEPROM

1. Bus master sends START condition
2. Bus master sends 7-bit slave address plus low R/W bit (E8h)
3. TPS65642A acknowledges
4. Bus master sends address of Control Register (FFh)
5. TPS65642A acknowledges
6. Bus master sends data to be written to the Control Register (80h)
7. TPS65642A acknowledges
8. Bus master sends STOP condition

**Figure 5-31. Saving Contents of all RAM Registers to E<sup>2</sup>PROM**

### 5.11.21 Example – Reading from a Single RAM Register

1. Bus master sends START condition
2. Bus master sends 7-bit slave address plus low R/W bit (E8h)
3. TPS65642A acknowledges
4. Bus master sends address of Control Register (FFh)
5. TPS65642A acknowledges
6. Bus master sends data for Control Register (00h)
7. TPS65642A acknowledges
8. Bus master sends STOP condition
9. Bus master sends START condition
10. Bus master sends 7-bit slave address plus low R/W bit (E8h)
11. TPS65642A acknowledges
12. Bus master sends address of RAM register (00h)
13. TPS65642A acknowledges
14. Bus master sends REPEATED START condition
15. Bus master sends 7-bit slave address plus high R/W bit (E9h)
16. TPS65642A acknowledges
17. TPS65642A sends RAM register data
18. Bus master does not acknowledge
19. Bus master sends STOP condition

**Figure 5-32. Reading from a Single RAM Register**

### 5.11.22 Example – Reading from a Single EEPROM Register

1. Bus master sends START condition
2. Bus master sends 7-bit slave address plus low R/W bit (E8h)
3. TPS65642A acknowledges
4. Bus master sends address of Control Register (FFh)
5. TPS65642A acknowledges
6. Bus master sends data for Control Register (01h)
7. TPS65642A acknowledges
8. Bus master sends STOP condition
9. Bus master sends START condition
10. Bus master sends 7-bit slave address plus low R/W bit (E8h)
11. TPS65642A acknowledges
12. Bus master sends address of EEPROM register (00h)
13. TPS65642A acknowledges
14. Bus master sends REPEATED START condition
15. Bus master sends 7-bit slave address plus high R/W bit (E9h)
16. TPS65642A acknowledges
17. TPS65642A sends EEPROM register data
18. Bus master does not acknowledge
19. Bus master sends STOP condition

**Figure 5-33. Reading from a Single EEPROM Register**

### 5.11.23 Example – Reading from Multiple RAM Registers

1. Bus master sends START condition
2. Bus master sends 7-bit slave address plus low R/W bit (E8h)
3. TPS65642A acknowledges
4. Bus master sends address of Control Register (FFh)
5. TPS65642A acknowledges
6. Bus master sends data for Control Register (00h)
7. TPS65642A acknowledges
8. Bus master sends STOP condition
9. Bus master sends START condition
10. Bus master sends 7-bit slave address plus low R/W bit (E8h)
11. TPS65642A acknowledges
12. Bus master sends address of first register to be read (00h)
13. TPS65642A acknowledges
14. Bus master sends REPEATED START condition
15. Bus master sends 7-bit slave address plus high R/W bit (E9h)
16. TPS65642A acknowledges
17. TPS65642A sends contents of first RAM register to be read
18. Bus master acknowledges
19. TPS65642A sends contents of second RAM register to be read
20. Bus master acknowledges
21. TPS65642A sends contents of third (last) RAM register to be read
22. Bus master does not acknowledge
23. Bus master sends STOP condition

**Figure 5-34. Reading from Multiple RAM Registers**

### 5.11.24 Example – Reading from Multiple EEPROM Registers

1. Bus master sends START condition
2. Bus master sends 7-bit slave address plus low R/W bit (E8h)
3. TPS65642A acknowledges
4. Bus master sends address of Control Register (FFh)
5. TPS65642A acknowledges
6. Bus master sends data for Control Register (01h)
7. TPS65642A acknowledges
8. Bus master sends STOP condition
9. Bus master sends START condition
10. Bus master sends 7-bit slave address plus low R/W bit (E8h)
11. TPS65642A acknowledges
12. Bus master sends address of first EEPROM register to be read (00h)
13. TPS65642A acknowledges
14. Bus master sends REPEATED START condition
15. Bus master sends 7-bit slave address plus high R/W bit (E9h)
16. TPS65642A acknowledges
17. TPS65642A sends contents of first EEPROM register to be read
18. Bus master acknowledges
19. TPS65642A sends contents of second EEPROM register to be read
20. Bus master acknowledges
21. TPS65642A sends contents of third (last) EEPROM register to be read
22. Bus master does not acknowledge
23. Bus master sends STOP condition

**Figure 5-35. Reading from Multiple EEPROM Registers**

### 5.11.25 Configuration Parameter VCOM

**Figure 5-36. VCOM Register Bit Allocation**

7	6	5	4	3	2	1	0
VCOM							P
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

LEGEND: R/W = Read/Write; R = Read only; -n = factory default

**Table 5-17. VCOM Register Field Descriptions**

Bit	Field	Value	Description
7–1	VCOM	00h–7F <sub>h</sub>	During write operations these bits contain the data to be written. During read operations these bits contain the contents of the EEPROM register. $I_{OUT} = \frac{V_{REF}}{R_{SET}} \times \frac{VCOM + 1}{128}$
0	P	0	During write operations this bit configures the destination for data. <b>Data is written to the DAC register and EEPROM.</b>
		1	Data is written to the DAC register only.
		0	During read operations this bit indicates whether the contents of the RAM register and EEPROM are the same or not. DAC register and EEPROM contents are the same.
		1	DAC register and EEPROM contents are different.

### 5.11.26 Example – Writing a VCOM Value of 77h to RAM Register Only

1. Bus master sends a START condition.
2. Bus master sends 9E hexadecimal (7-bit slave address plus low R/W bit).
3. TPS65642A slave acknowledges.
4. Bus master sends EF hexadecimal (data to be written plus LSB = 1).
5. TPS65642A slave acknowledges.
6. Bus master sends a STOP condition.

**Figure 5-37. Writing a VCOM Value of 77h to RAM Only**

### 5.11.27 Example – Writing a VCOM Value of 77h to EEPROM and RAM

1. Bus master sends a START condition.
2. Bus master sends 9E hexadecimal (7-bit slave address plus low R/W bit).
3. TPS65642A slave acknowledges.
4. Bus master sends EE hexadecimal (data to be written plus LSB = 0).
5. TPS65642A slave acknowledges.
6. Bus master sends a STOP condition.

**Figure 5-38. Writing a VCOM Value of 77h to EEPROM and RAM**

### 5.11.28 Example — Reading a VCOM Value of 77h from EEPROM When RAM Contents are Identical

1. Bus master sends a START condition.
2. Bus master sends 9F hexadecimal (7-bit slave address plus high R/W bit).
3. TPS65642A slave acknowledges.
4. TPS65642A sends EE hexadecimal from EEPROM (data to be read plus LSB = '0').
5. Bus master does not acknowledge.
6. Bus master sends a STOP condition.

Figure 5-39. Reading 77h from EEPROM when RAM Contents are Identical

### 5.11.29 Example — Reading a VCOM Value of 77h from EEPROM When RAM Contents are Different

1. Bus master sends a START condition.
2. Bus master sends 9F hexadecimal (7-bit slave address plus high R/W bit).
3. TPS65642A slave acknowledges.
4. TPS65642A sends EF hexadecimal from RAM (data to be read plus LSB = '0').
5. Bus master does not acknowledge.
6. Bus master sends a STOP condition.

Figure 5-40. Reading 77h from EEPROM when RAM Contents are Different

### 5.11.30 I<sup>2</sup>C Interface

Configuration parameters and the  $V_{COM}$  voltage setting are programmed through an industry standard I<sup>2</sup>C serial interface. The TPS65642A device always works as a slave device and supports standard (100 kbps) and fast (400 kbps) modes of operation. During write operations, all further attempts to access the slave addresses are ignored until the current write operation is complete.

#### NOTE

The I<sup>2</sup>C interface contains a known bug. If a new start condition appears on the bus before transfer of the slave address byte from a previously initiated read/write operation is complete, the I<sup>2</sup>C interface may hang. Normal operation is recovered after cycling  $V_{IN}$ .

## 5.12 POWER SEQUENCING

1. Buck converter 1 ( $V_{CORE}$ ), Buck converter 2 ( $V_{IO1}$ ), and the linear regulator ( $V_{IO2}$ ) start as soon as  $V_{IN} > V_{UVLO}$ .
2. The reset generator holds  $\overline{RST}$  low until  $t_{RESET}$  seconds after  $V_{CORE}$  has reached power good status.
3. Boost converter 1 starts  $t_{DLY1}$  milliseconds after EN goes high (or  $\overline{RST}$  has gone high, whichever occurs later). Once asserted, the EN signal must remain high to ensure normal device operation. Once disabled ( $EN = 0$ ), boost converter 1 remains disabled until the device is powered down (even if EN is re-asserted).
4. Boost converter 2 starts as soon as  $AV_{DD}$  has reached power-good status.
5. In non-GIP mode,  $V_{GHM}$  is held at high impedance until  $t_{DLY6}$  milliseconds after  $V_{GH}$  reaches power-good status;  $\overline{XAO}$  goes high when  $V_{IN} > V_{DET}$  and low when  $V_{IN} < V_{DET}$ .
6. In GIP mode,  $\overline{XAO}$  is held low until  $t_{DLY6}$  milliseconds after  $V_{GH}$  reaches power-good status.

Figure 5-41 and Figure 5-42 show the typical power-up or down characteristics of the TPS65642A device

Figure 5-41. Power-Up or Power-Down Sequencing With EN Connected to VIN

Figure 5-42. Power-Up or Power-Down Sequencing With EN Connected to T-CON Ready

## 5.13 UNDERVOLTAGE LOCKOUT

An undervoltage lockout function disables the TPS65642A device when the supply voltage is too low for proper operation.

## 6 Application Information

### 6.1 External Component Selection

Care must be applied to the choice of external components because these components greatly affect overall performance. The TPS65642A device was developed with the two goals of high performance and small or low-profile solution size. Because these two goals are often in direct opposition to one another (for example, larger inductors tend to achieve higher efficiencies), some trade-off is always necessary.

Inductors must have adequate current capability so that the inductors do not saturate under worst-case conditions. For high efficiency, inductors must also have low DC resistance (DCR).

Capacitors must have adequate *effective* capacitance under the applicable DC bias conditions they experience in the application. MLCC capacitors typically exhibit only a fraction of the nominal capacitance under real-world conditions and this must be taken into consideration when selecting capacitors. This problem is especially acute in low profile capacitors, in which the dielectric field strength is higher than in taller components. In general, the capacitance values shown in the circuit diagrams in this data sheet refer to the *effective* capacitance after DC bias effects have been taken into consideration. Reputable capacitor manufacturers provide capacitance-versus-DC-bias curves that greatly simplify component selection.

[Table 6-1](#), [Table 6-2](#), [Table 6-3](#), [Table 6-4](#), and [Table 6-5](#) list some components suitable for use with the TPS65642A device. The list is not exhaustive — other components may exist that are equally suitable (or better), however, these components have been proven to work well and were used extensively during the development of the TPS65642A device.

**Table 6-1. Boost Converter 1 External Components**

REF.	DESCRIPTION	PART NUMBER	MANUFACTURER	THICKNESS

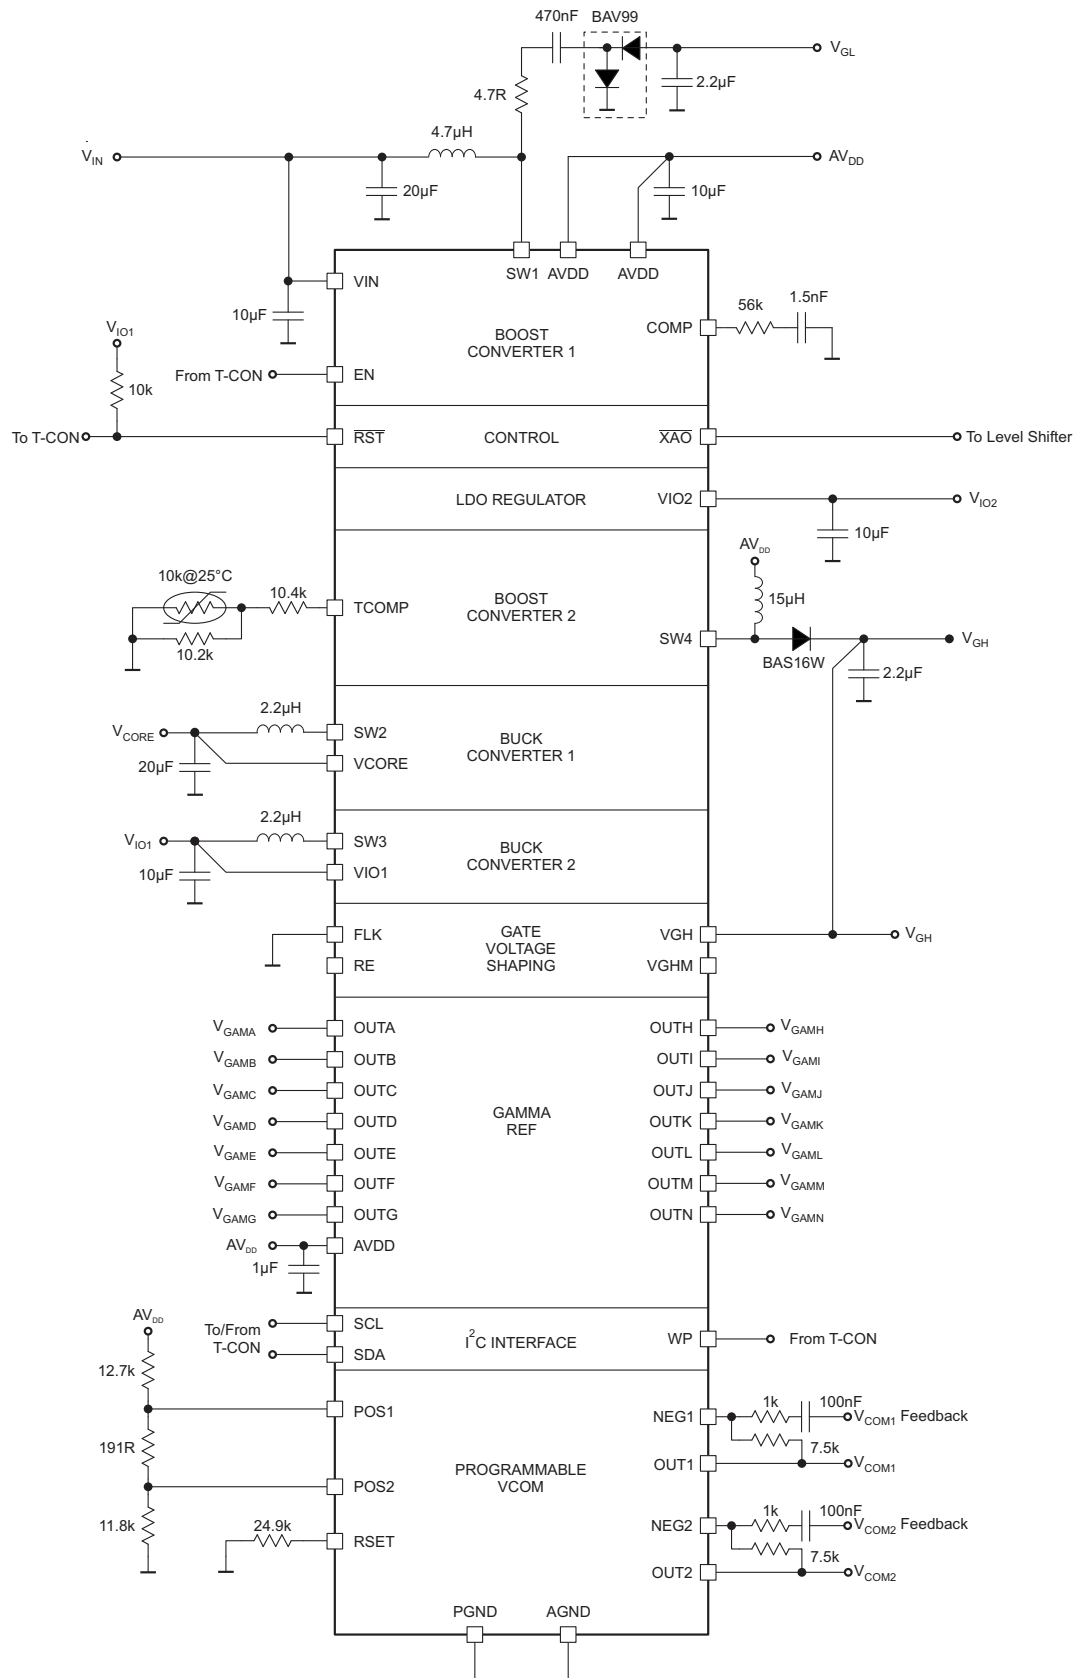

Figure 6-2. Typical Application Circuit for GIP Displays

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65642AYFFR	ACTIVE	DSBGA	YFF	56	3000	Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-40 to 85	TPS65642A	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
