

## TPS74401 3.0-A, Ultra-LDO with Programmable Soft-Start

### 1 Features

- Input Voltage Range: 1.1 V to 5.5 V
- Soft-Start (SS) Pin Provides a Linear Startup With Ramp Time Set by External Capacitor
- 1% Accuracy Over Line, Load, and Temperature
- Supports Input Voltages as Low as 0.9 V With External Bias Supply
- Adjustable Output: 0.8 V to 3.6 V
- Ultra-Low Dropout: 115 mV at 3.0 A (typical)
- Stable With Any or No Output Capacitor
- Excellent Transient Response
- Open-Drain Power-Good (VQFN Only)
- Available in 5-mm × 5-mm × 1-mm VQFN and DDPAK-7 Packages

### 2 Applications

- FPGA Applications
- DSP Core and I/O Voltages
- Post-Regulation Applications
- Applications With Special Start-Up Time or Sequencing Requirements
- Hot-Swap and Inrush Controls

### 3 Description

The TPS74401 low-dropout (LDO) linear regulators provide an easy-to-use robust power-management solution for a wide variety of applications. The user-programmable soft-start minimizes stress on the input power source by reducing capacitive inrush current on start-up. The soft-start is monotonic and well-suited for powering many different types of processors and application-specific integrated circuits (ASICs). The enable input and power-good output allow easy sequencing with external regulators. This complete flexibility lets the user configure a solution that meets the sequencing requirements of field-programmable gate arrays (FPGAs), digital signal processors (DSPs), and other applications with specific start-up requirements.

A precision reference and error amplifier deliver 1% accuracy over load, line, temperature, and process. The TPS74401 family of LDOs is stable without an output capacitor or with ceramic output capacitors. The device family is fully specified from  $T_J = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ . The TPS74401 is offered in a small (5-mm × 5-mm) VQFN package, yielding a highly compact total solution size. For applications that require additional power dissipation, the DDPAK (KTV) package is also available.

#### Typical Application Circuits

##### ADJUSTABLE VOLTAGE VERSION

##### FIXED VOLTAGE VERSION

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS74401	TO-263 (7)	10.10 mm × 8.89 mm
	VQFN (20)	5.00 mm × 5.00 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision P (January 2015) to Revision Q</b>	<b>Page</b>
• Changed QFN to VQFN throughout document .....	<b>1</b>
• Changed TPS744xx to TPS74401 throughout document .....	<b>1</b>
• Deleted fixed output Features bullet.....	<b>1</b>
• Changed $V_{BIAS}$ minimum value in <i>Recommended Operating Conditions</i> table.....	<b>5</b>
• Changed footnote 1 for <i>Recommended Operating Conditions</i> table.....	<b>5</b>
• Added second row to $V_{OUT}$ accuracy parameter .....	<b>6</b>
• Added last four rows to $V_{DO}$ , $V_{BIAS}$ dropout voltage parameter .....	<b>6</b>
• Added <i>Timing Requirements</i> table .....	<b>7</b>
• Added <i>Device Functional Modes</i> section .....	<b>15</b>
• Changed third paragraph of <i>Dropout Voltage</i> .....	<b>19</b>
• Changed first sentence of <i>Without an Auxiliary Bias</i> section .....	<b>25</b>
• Changed <i>Power Dissipation</i> section location; moved to after <i>Layout Example</i> section.....	<b>26</b>
• Added <i>Development Support</i> section .....	<b>30</b>
• Added information about reference design TIDU421 and user guide SLVU143 to <i>Related Documentation</i> section .....	<b>30</b>

<b>Changes from Revision O (March 2013) to Revision P</b>	<b>Page</b>
• Deleted Active High Enable bullet from <i>Features</i> list .....	<b>1</b>
• Added <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	<b>5</b>
• Changed footnote 3c for <i>Thermal Information</i> table .....	<b>6</b>
• Changed y-axis in <a href="#">Figure 1</a> , <a href="#">Figure 2</a> , <a href="#">Figure 4</a> , and <a href="#">Figure 7</a> from abbreviation ( $I_{OUT}$ ) to text (Output Current) .....	<b>8</b>
• Added "V" to $V_{IN} = 1.8$ V condition in <a href="#">Figure 9</a> , <a href="#">Figure 10</a> , and <a href="#">Figure 11</a> .....	<b>8</b>
• y-axis and graph title in <a href="#">Figure 15</a> from abbreviation ( $I_{OUT}$ ) to text (Output Current) .....	<b>9</b>

• Changed <a href="#">Figure 25</a> ; made $V_{OUT}$ trace red to show data trend separation .....	11
• Changed <a href="#">Overview</a> section text.....	13
• Changed second paragraph of <a href="#">Dropout Voltage</a> .....	19
• Changed <a href="#">Figure 29</a> ; updated equation in figure .....	20

---

<b>Changes from Revision N (December 2012) to Revision O</b>	<b>Page</b>
--	-------------

---

• Changed RGW and KTW values in Thermal Information table.....	6
--	---

---

<b>Changes from Revision M (November 2010) to Revision N</b>	<b>Page</b>
--	-------------

---

• Changed $T_J$ max value from 125 to 150 in Absolute Maximum Ratings table.....	5
--	---

---

<b>Changes from Revision L (August, 2010) to Revision M</b>	<b>Page</b>
---	-------------

---

• Corrected equation for <a href="#">Table 2</a> .....	17
--	----

---

<b>Changes from Revision K (December, 2009) to Revision L</b>	<b>Page</b>
---	-------------

---

• Replaced the <i>Dissipation Ratings</i> table with the <i>Thermal Information</i> table .....	6
• Revised <i>Layout Recommendations and Power Dissipation</i> section .....	26
• Revised <a href="#">Thermal Considerations</a> section .....	27

---

## 5 Pin Configuration and Functions

### Pin Functions

NAME	PIN		I/O	DESCRIPTION
	KTW	RGW		
BIAS	6	10	I	Bias input voltage for error amplifier, reference, and internal control circuits. A 1- $\mu$ F or larger input capacitor is recommended for optimal performance. If IN is connected to BIAS, use a 4.7 $\mu$ F or larger capacitor.
EN	7	11	I	Enable pin. Driving this pin high enables the regulator. Driving this pin low puts the regulator into shutdown mode. This pin must not be left floating.
FB	2	16	I	This pin is the feedback connection to the center tap of an external resistor divider network that sets the output voltage. This pin must not be left floating. (Adjustable version only.)
GND	4	12	—	Ground
IN	5	5–8	I	Unregulated input to the device. An input capacitor of 1 $\mu$ F or greater is recommended for optimal performance.
NC	N/A	2–4, 13, 14, 17	O	No connection. This pin can be left floating or connected to GND to allow better thermal contact to the top-side plane.
OUT	3	1, 18–20	O	Regulated output voltage. No capacitor is required on this pin for stability, but is recommended for optimal performance.
PAD/TAB	—	—	—	Must be soldered to the ground plane for increased thermal performance. Internally connected to ground.
PG	N/A	9	O	Power-good (PG) is an open-drain, active-high output that indicates the status of $V_{OUT}$ . When $V_{OUT}$ exceeds the PG trip threshold, the PG pin goes into a high-impedance state. When $V_{OUT}$ is below this threshold, the pin is driven to a low-impedance state. Connect a pullup resistor from 10 k $\Omega$ to 1 M $\Omega$ from this pin to a supply up to 5.5 V. The supply can be higher than the input voltage. Alternatively, the PG pin can be left floating if output monitoring is not necessary.
SNS	2	16	I	This pin is the sense connection to the load device. This pin must be connected to $V_{OUT}$ and must not be left floating. (Fixed versions only.)
SS	1	15	—	Soft-start pin. A capacitor connected on this pin to ground sets the start-up time. If this pin is left floating, the regulator output soft-start ramp time is typically 100 $\mu$ s.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
$V_{IN}, V_{BIAS}$	Input voltage	-0.3	6	V
$V_{EN}$	Enable voltage	-0.3	6	V
$V_{PG}$	Power-good voltage	-0.3	6	V
$I_{PG}$	PG sink current	0	1.5	mA
$V_{SS}$	SS pin voltage	-0.3	6	V
$V_{FB}$	Feedback pin voltage	-0.3	6	V
$V_{OUT}$	Output voltage	-0.3	$V_{IN} + 0.3$	V
$I_{OUT}$	Maximum output current	Internally limited		
	Output short-circuit duration	Indefinite		
$P_{DISS}$	Continuous total power dissipation	See <a href="#">Thermal Information</a>		
$T_J$	Operating junction temperature	-40	150	°C
$T_{stg}$	Storage temperature	-55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000
		Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{IN}$	Input supply voltage range	1.1		5.5	V
$V_{EN}$	Enable supply voltage range	0		5.5	V
$V_{BIAS}$ <sup>(1)</sup>	BIAS supply voltage range	$V_{OUT} + V_{DO} (V_{BIAS})$		5.5	V
$I_{OUT}$	Output current	0		3	A
$C_{OUT}$	Output capacitor	0			µF
$C_{IN}$ <sup>(2)</sup>	Input capacitor	1			µF
$C_{BIAS}$	Bias capacitor	1			µF
$T_J$	Operating junction temperature	-40		125	°C

(1) BIAS supply is required when  $V_{IN}$  is below  $V_{OUT} + V_{DO} (V_{BIAS})$ .

(2) If  $V_{IN}$  and  $V_{BIAS}$  are connected to the same supply, the recommended minimum capacitor for the supply is 4.7 µF.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)(2)</sup>		TPS74401 <sup>(3)</sup>		UNIT
		RGW (VQFN)	KTW (DDPAK)	
		20 PINS	7 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	35.4	26.6	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	32.4	41.7	
R <sub>θJB</sub>	Junction-to-board thermal resistance	14.7	12.5	
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.4	4.0	
ψ <sub>JB</sub>	Junction-to-board characterization parameter	14.8	7.3	
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	3.9	0.3	

(1) For more information about traditional and new thermal metrics, see the [IC Package Thermal Metrics](#) application report, [SPRA953](#).

(2) For thermal estimates of this device based on PCB copper area, see the [TI PCB Thermal Calculator](#).

(3) Thermal data for the RGW and KTW packages are derived by thermal simulations based on JEDEC-standard methodology as specified in the JESD51 series. The following assumptions are used in the simulations:

(a) i. RGW: The exposed pad is connected to the PCB ground layer through a 4x4 thermal via array.

ii. KTW: The exposed pad is connected to the PCB ground layer through a 6x6 thermal via array.

(b) Each of top and bottom copper layers has a dedicated pattern for 20% copper coverage.

(c) These data were generated with only a single device at the center of a JEDEC high-K (2s2p) board with 3in x 3in copper area. To understand the effects of the copper area on thermal performance, refer to the [Thermal Considerations](#) section.

## 6.5 Electrical Characteristics

At  $V_{EN} = 1.1\text{ V}$ ,  $V_{IN} = V_{OUT} + 0.3\text{ V}$ ,  $C_{IN} = C_{BIAS} = 0.1\text{ }\mu\text{F}$ ,  $C_{OUT} = 10\text{ }\mu\text{F}$ ,  $I_{OUT} = 50\text{ mA}$ ,  $V_{BIAS} = 5.0\text{ V}$ , and  $T_J = -40^\circ\text{C}$  to  $125^\circ\text{C}$ , unless otherwise noted. Typical values are at  $T_J = 25^\circ\text{C}$ .

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>IN</sub>	Input voltage range		V <sub>OUT</sub> + V <sub>DO</sub>		5.5	V
V <sub>BIAS</sub>	Bias pin voltage range		2.375		5.25	V
V <sub>REF</sub>	Internal reference (adjustable version)	T <sub>J</sub> = 25°C	0.796	0.8	0.804	V
V <sub>OUT</sub>	Output voltage range	V <sub>IN</sub> = 5 V, I <sub>OUT</sub> = 1.5 A, V <sub>BIAS</sub> = 5 V	V <sub>REF</sub>		3.6	V
	Accuracy	2.97 V ≤ V <sub>BIAS</sub> ≤ 5.25 V, V <sub>OUT</sub> + 1.62 V ≤ V <sub>BIAS</sub> , 50 mA ≤ I <sub>OUT</sub> ≤ 3.0 A <sup>(1)</sup>	-1%	±0.2%	1%	
		V <sub>OUT</sub> + V <sub>DO</sub> , BIAS ≤ V <sub>BIAS</sub> ≤ 5.25 V, 100 mA ≤ I <sub>OUT</sub> ≤ I <sub>VDO BIAS</sub> , VQFN <sup>(2)</sup>	-1%	±0.2%	1%	
ΔV <sub>OUT(ΔVIN)</sub>	Line regulation	V <sub>OUT(nom)</sub> + 0.3 ≤ V <sub>IN</sub> ≤ 5.5 V, VQFN	0.0005		0.05	%/V
		V <sub>OUT(nom)</sub> + 0.3 ≤ V <sub>IN</sub> ≤ 5.5 V, DDPAK	0.0005		0.06	%/V
ΔV <sub>OUT(ΔIOUT)</sub>	Load regulation	0 mA ≤ I <sub>OUT</sub> ≤ 50 mA	0.013			%/mA
		50 mA ≤ I <sub>OUT</sub> ≤ 3.0 A	0.03			%/A
V <sub>DO</sub>	V <sub>IN</sub> dropout voltage <sup>(3)</sup>	I <sub>OUT</sub> = 3.0 A, V <sub>BIAS</sub> - V <sub>OUT(nom)</sub> ≥ 1.62 V, VQFN	115		195	mV
		I <sub>OUT</sub> = 3.0 A, V <sub>BIAS</sub> - V <sub>OUT(nom)</sub> ≥ 1.62 V, DDPAK	120		240	mV
	V <sub>BIAS</sub> dropout voltage <sup>(3)</sup>	I <sub>OUT</sub> = 3.0 A, V <sub>IN</sub> = V <sub>BIAS</sub>			1.62	V
		I <sub>OUT</sub> = 3.0 A			1.62	V
		I <sub>OUT</sub> = 1.0 A			1.35	V
		I <sub>OUT</sub> = 500 mA			1.27	V
		I <sub>OUT</sub> = 100 mA			1.16	V
I <sub>CL</sub>	Current limit	V <sub>OUT</sub> = 80% × V <sub>OUT(nom)</sub> , VQFN	3.8		6.0	A
		V <sub>OUT</sub> = 80% × V <sub>OUT(nom)</sub> , DDPAK	3.5		6.0	A
I <sub>BIAS</sub>	Bias pin current	I <sub>OUT</sub> = 0 mA to 3.0 A	2		4	mA
I <sub>SHDN</sub>	Shutdown supply current (V <sub>IN</sub> )	V <sub>EN</sub> ≤ 0.4 V	1		100	μA
I <sub>FB</sub> , I <sub>SNS</sub>	Feedback, sense pin current <sup>(4)</sup>	I <sub>OUT</sub> = 50 mA to 3.0 A	-250	95	250	nA

(1) Adjustable devices tested at 0.8 V; external resistor tolerance is not taken into account.

(2) V<sub>OUT</sub> is set to 1.5 V to avoid minimum V<sub>BIAS</sub> restrictions.

(3) Dropout is defined as the voltage from the input to V<sub>OUT</sub> when V<sub>OUT</sub> is 2% below nominal.

(4) I<sub>FB</sub>, I<sub>SNS</sub> current flow is out of the device.

## Electrical Characteristics (continued)

At  $V_{EN} = 1.1\text{ V}$ ,  $V_{IN} = V_{OUT} + 0.3\text{ V}$ ,  $C_{IN} = C_{BIAS} = 0.1\text{ }\mu\text{F}$ ,  $C_{OUT} = 10\text{ }\mu\text{F}$ ,  $I_{OUT} = 50\text{ mA}$ ,  $V_{BIAS} = 5.0\text{ V}$ , and  $T_J = -40^\circ\text{C}$  to  $125^\circ\text{C}$ , unless otherwise noted. Typical values are at  $T_J = 25^\circ\text{C}$ .

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
PSRR <sup>(5)</sup>	Power-supply rejection ( $V_{IN}$ to $V_{OUT}$ )	1 kHz, $I_{OUT} = 1.5\text{ A}$ , $V_{IN} = 1.8\text{ V}$ , $V_{OUT} = 1.5\text{ V}$		73		dB
		800 kHz, $I_{OUT} = 1.5\text{ A}$ , $V_{IN} = 1.8\text{ V}$ , $V_{OUT} = 1.5\text{ V}$		42		dB
	Power-supply rejection ( $V_{BIAS}$ to $V_{OUT}$ )	1 kHz, $I_{OUT} = 1.5\text{ A}$ , $V_{IN} = 1.8\text{ V}$ , $V_{OUT} = 1.5\text{ V}$		62		dB
		800 kHz, $I_{OUT} = 1.5\text{ A}$ , $V_{IN} = 1.8\text{ V}$ , $V_{OUT} = 1.5\text{ V}$		50		dB
$V_n$	Output noise voltage	100 Hz to 100 kHz, $I_{OUT} = 1.5\text{ A}$ , $C_{SS} = 0.001\text{ }\mu\text{F}$		$16 \times V_{OUT}$		$\mu\text{V}_{RMS}$
$V_{TRAN}$	% $V_{OUT}$ droop during load transient	$I_{OUT} = 100\text{ mA}$ to $3.0\text{ A}$ at $1\text{ A}/\mu\text{s}$ , $C_{OUT} = 0\text{ }\mu\text{F}$		4		% $V_{OUT}$

## 7 Detailed Description

### 7.1 Overview

The TPS74401 family of low-dropout regulators (LDOs) incorporates many features to ensure a wide range of uses. Hysteresis and de-glitch on the EN input improve the ability to sequence multiple devices without worrying about false start-up. The soft-start is fully programmable and allows the user to control the startup time of the LDO output. Hysteresis is also available on the PG comparator to ensure no false PG signals. The TPS74401 family of LDOs is ideal for FPGAs, DSPs, and any other device that requires linear supply and sequencing.

### 7.2 Functional Block Diagrams

Figure 26. Adjustable Voltage Version

**Functional Block Diagrams (continued)**

**Figure 27. Fixed Voltage Versions**
**7.3 Feature Description**
**7.3.1 Enable, Shutdown**

The enable (EN) pin is active high and compatible with standard digital signaling levels.  $V_{EN}$  lower than 0.4 V turns the regulator off, whereas  $V_{EN}$  above 1.1 V turns the regulator on. Unlike many regulators, the enable circuitry has hysteresis and de-glitching for use with relatively slow-ramping analog signals. This configuration allows the TPS74401 to be enabled by connecting the output of another supply to the EN pin. The enable circuitry typically has 50 mV of hysteresis and a de-glitch circuit to help avoid on-off cycling resulting from small glitches in the  $V_{EN}$  signal.

The enable threshold is typically 0.8 V and varies with temperature and process variations. Temperature variation is approximately  $-1$  mV/°C; therefore, process variation accounts for most of the variation in the enable threshold. If precise turn-on timing is required, use a fast rise-time signal to enable the TPS74401.

If not used, EN can be connected to either IN or BIAS. If EN is connected to IN, connect EN as close as possible to the largest capacitance on the input to prevent voltage droops on that line from triggering the enable circuit.

**7.3.2 Power-Good (VQFN Package Only)**

The power-good (PG) pin is an open-drain output and can be connected to any 5.5 V or lower rail through an external pullup resistor. This pin requires at least 1.1 V on  $V_{BIAS}$  in order to have a valid output. The PG output is high-impedance when  $V_{OUT}$  is greater than  $(V_{IT} + V_{HYS})$ . If  $V_{OUT}$  drops below  $V_{IT}$  or if  $V_{BIAS}$  drops below 1.9 V, the open-drain output turns on and pulls the PG output low. The PG pin also asserts when the device is disabled. The recommended operating condition of the PG pin sink current is up to 1 mA, thus the pullup resistor for PG must be in the range of 10 kΩ to 1 MΩ. PG is only provided on the VQFN package. If output voltage monitoring is not needed, the PG pin can be left floating.

## Feature Description (continued)

### 7.3.3 Internal Current Limit

The TPS74401 features a factory-trimmed, accurate current limit that is flat over temperature and supply voltage. The current limit allows the device to supply surges of up to 3.5 A and maintain regulation. The current limit responds in approximately 10  $\mu$ s to reduce the current during a short-circuit fault. Recovery from a short-circuit condition is well-controlled and results in very little output overshoot when the load is removed. See [Figure 25](#) in the [Typical Characteristics](#) section for short-circuit recovery performance.

The internal current limit protection circuitry of the TPS74401 is designed to protect against overload conditions. This circuitry is not intended to allow operation above the rated current of the device. Continuously running the TPS74401 above the rated current degrades device reliability.

### 7.3.4 Thermal Protection

Thermal protection disables the output when the junction temperature rises to approximately 155°C, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is enabled. Depending on power dissipation, thermal resistance, and ambient temperature the thermal protection circuit can cycle on and off. This cycling limits the dissipation of the regulator, protecting it from damage as a result of overheating.

Activation of the thermal protection circuit indicates excessive power dissipation or inadequate heatsinking. For reliable operation, limit junction temperature to 125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, trigger thermal protection at least 30°C above the maximum expected ambient condition of the application. This condition produces a worst-case junction temperature of 125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS74401 is designed to protect against overload conditions. This circuitry is not intended to replace proper heatsinking. Continuously running the TPS74401 into thermal shutdown degrades device reliability.

## 7.4 Device Functional Modes

### 7.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage and bias voltage are both at least at the respective minimum specifications.
- The enable voltage has previously exceeded the enable rising threshold voltage and has not decreased below the enable falling threshold.
- The output current is less than the current limit.
- The device junction temperature is less than the maximum specified junction temperature.
- The device is not operating in dropout.

### 7.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this condition, the output voltage is the same as the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass device is in a triode state and no longer controls the current through the LDO. Line or load transients in dropout can result in large output voltage deviations.

## Device Functional Modes (continued)

### 7.4.3 Disabled

The device is disabled under the following conditions:

- The input or bias voltages are below the respective minimum specifications.
- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature.

[Table 1](#) shows the conditions that lead to the different modes of operation.

**Table 1. Device Functional Mode Comparison**

OPERATING MODE	PARAMETER				
	V <sub>IN</sub>	V <sub>EN</sub>	V <sub>BIAS</sub>	I <sub>OUT</sub>	T <sub>J</sub>
Normal mode	V <sub>IN</sub> > V <sub>OUT(nom)</sub> + V <sub>DO</sub> (V <sub>IN</sub> )	V <sub>EN</sub> > V <sub>EN(high)</sub>	V <sub>BIAS</sub> ≥ V <sub>OUT</sub> + 1.62 V	I <sub>OUT</sub> < I <sub>CL</sub>	T <sub>J</sub> < 125°C
Dropout mode	V <sub>IN</sub> < V <sub>OUT(nom)</sub> + V <sub>DO</sub> (V <sub>IN</sub> )	V <sub>EN</sub> > V <sub>EN(high)</sub>	V <sub>BIAS</sub> < V <sub>OUT</sub> + 1.62 V	—	T <sub>J</sub> < 125°C
Disabled mode (any true condition disables the device)	V <sub>IN</sub> < V <sub>IN(min)</sub>	V <sub>EN</sub> < V <sub>EN(low)</sub>	V <sub>BIAS</sub> < V <sub>BIAS(min)</sub>	—	T <sub>J</sub> > 155°C

## 7.5 Programming

### 7.5.1 Programmable Soft-Start

The TPS74401 features a programmable, monotonic, voltage-controlled soft-start that is set with an external capacitor (C<sub>SS</sub>). This feature is important for many applications to eliminate power-up initialization problems when powering FPGAs, DSPs, or other processors. The controlled voltage ramp of the output also reduces peak inrush current during start-up, minimizing start-up transients to the input power bus.

To achieve a linear and monotonic soft-start, the TPS74401 error amplifier tracks the voltage ramp of the external soft-start capacitor until the voltage exceeds the internal reference. The soft-start ramp time depends on the soft-start charging current (I<sub>SS</sub>), the soft-start capacitance (C<sub>SS</sub>), and the internal reference voltage (V<sub>REF</sub>), and can be calculated using [Equation 1](#):

$$t_{SS} = \frac{(V_{REF} \times C_{SS})}{I_{SS}} \quad (1)$$

If large output capacitors are used, the device current limit (I<sub>CL</sub>) and the output capacitor can set the start-up time. In this case, the start-up time is given by [Equation 2](#):

$$t_{SSCL} = \frac{(V_{OUT(nom)} \times C_{OUT})}{I_{CL(min)}}$$

where

- V<sub>OUT(nom)</sub> is the nominal set output voltage as set by the user,
  - C<sub>OUT</sub> is the output capacitance,
  - and I<sub>CL(min)</sub> is the minimum current limit for the device.
- (2)

In applications where monotonic startup is required, the soft-start time given by [Equation 1](#) must be set to be greater than [Equation 2](#).

## Programming (continued)

The maximum recommended soft-start capacitor is 0.015  $\mu\text{F}$ . Larger soft-start capacitors can be used and do not damage the device; however, the soft-start capacitor discharge circuit may not be able to fully discharge the soft-start capacitor when re-enabled. Soft-start capacitors larger than 0.015  $\mu\text{F}$  can be a problem in applications where the user must rapidly pulse the enable pin and also require the device to soft-start from ground.  $C_{\text{SS}}$  must be low-leakage; X7R, X5R, or C0G dielectric materials are preferred. Table 2 lists suggested soft-start capacitor values.

**Table 2. Standard Capacitor Values for Programming the Soft-Start Time<sup>(1)</sup>**

$C_{\text{SS}}$	SOFT-START TIME
Open	0.1 ms
470 pF	0.5 ms
1000 pF	1 ms
4700 pF	5 ms
0.01 $\mu\text{F}$	10 ms
0.015 $\mu\text{F}$	16 ms

$$(1) \quad t_{\text{SS}}(\text{s}) = \frac{V_{\text{REF}} \times C_{\text{SS}}}{I_{\text{SS}}} = \frac{0.8\text{V} \times C_{\text{SS}}(\text{F})}{0.73\mu\text{A}} \quad \text{where } t_{\text{SS}}(\text{s}) = \text{soft-start time in seconds.}$$

### 7.5.2 Sequencing Requirements

The device can have  $V_{\text{IN}}$ ,  $V_{\text{BIAS}}$ , and  $V_{\text{EN}}$  sequenced in any order without causing damage to the device. However, for the soft-start function to work as intended, certain sequencing rules must be applied. Enabling the device after  $V_{\text{IN}}$  and  $V_{\text{BIAS}}$  are present is preferred, and can be accomplished using a digital output from a processor or supply supervisor. An analog signal from an external RC circuit, as shown in Figure 28, can also be used as long as the delay time is long enough for  $V_{\text{IN}}$  and  $V_{\text{BIAS}}$  to be present.

**Figure 28. Soft-Start Delay Using an RC Circuit on Enable**

If a signal is not available to enable the device after  $V_{\text{IN}}$  and  $V_{\text{BIAS}}$ , simply connecting  $V_{\text{EN}}$  to  $V_{\text{IN}}$  is acceptable for most applications as long as  $V_{\text{IN}}$  is greater than 1.1 V and the ramp rate of  $V_{\text{IN}}$  and  $V_{\text{BIAS}}$  is faster than the set soft-start ramp rate. If the ramp rate of the input sources is slower than the set soft-start time, the output tracks the slower supply less the dropout voltage until the set output voltage is reached. If  $V_{\text{EN}}$  is connected to  $V_{\text{BIAS}}$ , the device soft-starts as programmed, provided that  $V_{\text{IN}}$  is present before  $V_{\text{BIAS}}$ . If  $V_{\text{BIAS}}$  and  $V_{\text{EN}}$  are present before  $V_{\text{IN}}$  is applied and the set soft-start time has expired, then  $V_{\text{OUT}}$  tracks  $V_{\text{IN}}$ .

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS74401 belongs to a family of new generation ultra-low dropout regulators that feature soft-start and tracking capabilities. These regulators use a low current bias input to power all internal control circuitry, allowing the NMOS pass transistor to regulate very low input and output voltages.

The use of an NMOS-pass FET offers several critical advantages for many applications. Unlike a PMOS topology device, the output capacitor has little effect on loop stability. This architecture allows the TPS74401 to be stable with any or even no output capacitor. Transient response is also superior to PMOS topologies, particularly for low  $V_{IN}$  applications.

The TPS74401 features a programmable, voltage-controlled soft-start circuit that provides a smooth, monotonic start-up and limits startup inrush currents that can be caused by large capacitive loads. A power-good (PG) output is available to allow supply monitoring and sequencing of other supplies. An enable (EN) pin with hysteresis and de-glitch allows slow-ramping signals to be used for sequencing the device. The low  $V_{IN}$  and  $V_{OUT}$  capability allows for inexpensive, easy-to-design, and efficient linear regulation between the multiple supply voltages often present in processor intensive systems.

#### 8.1.1 Input, Output, and Bias Capacitor Requirements

The TPS74401 does not require any output capacitor for stability. If an output capacitor is needed, the device is designed to be stable for all available types and values of output capacitance. The device is also stable with multiple capacitors in parallel, of any type or value. This flexibility is a result of an innovative control loop that ensures the device is stable independent of the output capacitance.

The capacitance required on the IN and BIAS pins strongly depends on the input supply source impedance. To counteract any inductance in the input, the minimum recommended capacitor for  $V_{IN}$  and  $V_{BIAS}$  is 1  $\mu\text{F}$ . If  $V_{IN}$  and  $V_{BIAS}$  are connected to the same supply, the recommended minimum capacitor for  $V_{BIAS}$  is 4.7  $\mu\text{F}$ . Use good quality, low-ESR capacitors on the input; ceramic X5R and X7R capacitors are preferred. Place these capacitors as close to the pins as possible for optimum performance and to help ensure stability.

#### 8.1.2 Transient Response

The TPS74401 is designed to have transient response within 5% for most applications without an output capacitor. In some cases, the transient response can be limited by the transient response of the input supply. This limitation is especially true in applications where the difference between the input and output is less than 300 mV. In this case, adding additional input capacitance improves the transient response much more than just adding additional output capacitance. With a solid input supply, adding additional output capacitance reduces undershoot and overshoot during a transient at the expense of a slightly longer  $V_{OUT}$  recovery time; see [Figure 20](#) in the *Typical Characteristics* section. Because the TPS74401 is stable without an output capacitor, many applications can allow for little or no capacitance at the LDO output. For these applications, local bypass capacitance for the device under power can be sufficient to meet the transient requirements of the application. This design reduces the total solution cost by avoiding the need to use expensive, high-value capacitors at the LDO output.

## Application Information (continued)

### 8.1.3 Dropout Voltage

The TPS74401 offers industry-leading dropout performance, making the device well-suited for high-current, low  $V_{IN}$  and low  $V_{OUT}$  applications. The extremely low dropout of the TPS74401 also allows the device to be used in place of a dc/dc converter and also achieve good efficiencies. Equation 3 provides a quick estimate of the efficiencies.

$$\text{Efficiency} \approx \frac{V_{OUT} \times I_{OUT}}{V_{IN} \times (I_{IN} + I_Q)} \approx \frac{V_{OUT}}{V_{IN}} \text{ at } I_{OUT} \gg I_Q \quad (3)$$

This efficiency allows users to redesign the power architecture for their applications to achieve the smallest, simplest, and lowest cost solution.

There are two different specifications for dropout voltage with the TPS74401. The first specification (see Figure 41) is referred to as  $V_{IN}$  Dropout and is for users who wish to apply an external bias voltage to achieve low dropout. This specification assumes that  $V_{BIAS}$  is at least 1.62 V above  $V_{OUT}$ ; for example, when  $V_{BIAS}$  is powered by a 3.3-V rail with 5% tolerance and with  $V_{OUT} = 1.5$  V. If  $V_{BIAS}$  is higher than ( $3.3 \text{ V} \times 0.95$ ) or  $V_{OUT}$  is less than 1.5 V,  $V_{IN}$  dropout is less than specified.

The second specification (see Figure 42) is referred to as  $V_{BIAS}$  Dropout and is for users who wish to have  $V_{BIAS} < V_{IN} + 1.62$  V. This option allows the device to be used in applications where an auxiliary bias voltage is not available or low dropout is not required. Dropout is limited by BIAS in these applications because  $V_{BIAS}$  provides the gate drive to the pass FET and therefore must be greater than  $V_{OUT} + V_{DO}(V_{BIAS})$ . Because of this usage, IN and BIAS tied together easily consume excessive power. Pay attention and do not exceed the power rating of the IC package.

### 8.1.4 Output Noise

The TPS74401 provides low output noise when a soft-start capacitor is used. When the device reaches the end of the soft-start cycle, the soft-start capacitor serves as a filter for the internal reference. By using a 0.001- $\mu$ F soft-start capacitor, the output noise is reduced by half and is typically 19  $\mu$ V<sub>RMS</sub> for a 1.2-V output (100 Hz to 100 kHz). Noise is a function of the set output voltage because most of the output noise is generated by the internal reference. The RMS noise with a 0.001- $\mu$ F soft-start capacitor is given in Equation 4.

$$V_N (\mu\text{V}_{RMS}) = 16 \left( \frac{\mu\text{V}_{RMS}}{V} \right) \times V_{OUT} (V) \quad (4)$$

The low output noise of the TPS74401 makes the device a good choice for powering transceivers, PLLs, or other noise-sensitive circuitry.

## 8.2 Typical Applications

### 8.2.1 Adjustable Voltage Part and Setting

Figure 29 shows a typical application circuit for the TPS74401 adjustable output device.

$R_1$  and  $R_2$  can be calculated for any output voltage using the formula shown in Figure 29. Table 3 lists sample resistor values of common output voltages. In order to achieve the maximum accuracy specifications,  $R_2$  must be  $\leq 4.99$  k $\Omega$ .

$$R_1 = \left[ \frac{V_{OUT}}{V_{REF}} - 1 \right] \times R_2$$

**Figure 29. Typical Application Circuit for the TPS74401 (Adjustable Version)**

**Table 3. Standard 1% Resistor Values for Programming the Output Voltage<sup>(1)</sup>**

$R_1$ (k $\Omega$ )	$R_2$ (k $\Omega$ )	$V_{OUT}$ (V)
Short	Open	0.8
0.619	4.99	0.9
1.13	4.53	1.0
1.37	4.42	1.05
1.87	4.99	1.1
2.49	4.99	1.2
4.12	4.75	1.5
3.57	2.87	1.8
3.57	1.69	2.5
3.57	1.15	3.3

(1)  $V_{OUT} = 0.8 \times (1 + R_1 / R_2)$ .

#### NOTE

When  $V_{BIAS}$  and  $V_{EN}$  are present and  $V_{IN}$  is not supplied, this device outputs approximately 50  $\mu$ A of current from OUT. Although this condition does not cause any damage to the device, the output current can charge up the OUT node if total resistance between OUT and GND (including external feedback resistors) is greater than 10 k $\Omega$ .

### 8.2.1.1 Design Requirements

The design goals are  $V_{IN} = 1.8\text{ V}$ ,  $V_{OUT} = 1.5\text{ V}$ , and  $I_{OUT} = 2\text{ A}$  max. The design optimizes transient response while meeting a 1-ms startup time with a startup dominated by the soft-start feature. The input supply comes from a supply on the same circuit board. The available system rails for  $V_{BIAS}$  are 2.7 V, 3.3 V, and 5 V.

The design space consists of  $C_{IN}$ ,  $C_{OUT}$ ,  $C_{BIAS}$ ,  $C_{SS}$ ,  $V_{BIAS}$ ,  $R_1$ ,  $R_2$ , and  $R_3$ , and the circuit is from [Figure 29](#).

This example uses a  $V_{IN}$  of 1.8 V, with a  $V_{BIAS}$  of 2.5 V.

### 8.2.1.2 Detailed Design Procedure

The first step for this design is to examine the maximum load current along with the input and output voltage requirements, to determine if the device thermal and dropout voltage requirements can be met. At 3 A, the input dropout voltage of the TPS74401 family is a maximum of 240 mV over temperature. As a result, the dropout headroom is sufficient for operation over both input and output voltage accuracy.

The maximum power dissipated in the linear regulator is the maximum voltage dropped across the pass element from the input to the output multiplied by the maximum load current. In this example, the maximum voltage drop across in the pass element is  $(1.8\text{ V} - 1.5\text{ V})$ , giving a  $V_{DROP} = 300\text{ mV}$ . The power dissipated can then be estimated by the equation  $P_{DISS} = I_{L(max)} \times V_{DROP} = \sim 600\text{ mW}$ . This calculation gives an efficiency of nearly 83.3% by using [Equation 3](#).

When the power dissipated in the linear regulator is known, the corresponding junction temperature increase can be calculated. To estimate the junction temperature increase above ambient, the power dissipated must be multiplied by the junction-to-ambient thermal resistance. For thermal resistance information, refer to the [Thermal Information](#) table. For this example, using the KTW package, the junction temperature rise is calculated to be 21.2°C. The maximum junction temperature increase is calculated by adding the junction temperature rise to the maximum ambient temperature. In this example, the maximum junction temperature is 46.2°C. Keep in mind that the junction temperature must be less than 125°C for reliable operation. Additional ground planes, added thermal vias, and air flow all help to improve the thermal transfer characteristics of the system.

The next step is to determine the bias voltage or if a separate source is needed for the bias voltage. Because  $V_{IN} \geq V_{OUT} + 1.62\text{ V}$ ,  $V_{BIAS}$  must be an independent supply.  $V_{BIAS} = V_{IN} + 1.62\text{ V} = 3.12\text{ V}$ ; the system has a 3.3-V rail to use for this supply and also to provide some limited headroom for  $V_{BIAS}$ . The 5-V rail is a better choice to improve the performance of the LDO, so the 5-V rail is used.

### 8.2.2 Fixed Voltage and Sense Pin

Figure 40 shows a typical application circuit for the TPS74401 fixed output device.

**Figure 40. Typical Application Circuit for the TPS74401 (Fixed Voltage)**

The fixed voltage version of the TPS74401 has a sense pin (SNS) so that the device can monitor its output voltage at the load device pin as closely as possible. Unlike other TI fixed-voltage LDOs, however, this pin must **not** be left floating but **must** be connected to an output node. See the TI application report, *Ultimate Regulation of with Fixed Output Versions of the TPS742xx, TPS743xx, and TPS744xx* (SBVA024), available for download from [www.ti.com](http://www.ti.com).

### 8.2.3 Using an Auxiliary Bias Rail

Figure 41 shows a typical application of the TPS74401 using an auxiliary bias rail. The auxiliary bias rail allows for the designer to specify the system to have a low  $V_{DO}$ . The bias rail supplies the error amplifier with a higher supply voltage, increasing the voltage that can be applied to the gate of the pass device.

$V_{BIAS}$  must be at least  $V_{OUT} + 1.62$  V.

**Figure 41. Typical Application of the TPS74401 Using an Auxiliary Bias Rail**

### 8.2.4 Without an Auxiliary Bias

The TPS74401 family is capable of operating without a bias rail if  $V_{IN} \geq V_{OUT} + V_{DO}$  ( $V_{BIAS}$ ). Additional capacitance is advised for this scenario, with at least 4.7  $\mu\text{F}$  of capacitance near the input pin. Figure 42 shows a typical application of the TPS74401 without an auxiliary bias.

If using the TPS74401 in this situation and under high load conditions, ensure that the printed circuit board (PCB) provides adequate thermal handling capabilities to keep the device in its recommended operating range. See the [Power Supply Recommendations](#) section for more information.

Figure 42. Typical Application of the TPS74401 Without an Auxiliary Bias

## 9 Power Supply Recommendations

The TPS744 is designed to operate from an input voltage between 1.1 V to 5.5 V, provided the bias rail is at least 1.62 V higher than the input supply. The bias rail and the input supply must both provide adequate headroom and current for the device to operate normally.

Connect a low output impedance power supply directly to the IN pin of the TPS744. This supply must have at least 1  $\mu\text{F}$  of capacitance near the IN pin for stability. A supply with similar requirements must also be connected directly to the bias rail with a separate 1  $\mu\text{F}$  or larger capacitor.

If the IN pin is tied to the bias pin, a minimum 4.7  $\mu\text{F}$  of capacitance is needed for stability.

To increase the overall PSRR of the solution at higher frequencies, use a pi-filter or ferrite bead before the input capacitor.

## 10 Layout

### 10.1 Layout Guidelines

An optimal layout can greatly improve transient performance, PSRR, and noise. To minimize the voltage droop on the input of the device during load transients, connect the capacitance on IN and BIAS as close as possible to the device. This capacitance also minimizes the effects of parasitic inductance and resistance of the input source and can therefore improve stability. To achieve optimal transient performance and accuracy, connect the top side of R<sub>1</sub> in Figure 29 as close as possible to the load. If BIAS is connected to IN, TI recommends connecting BIAS as close to the sense point of the input supply as possible. This connection minimizes the voltage droop on BIAS during transient conditions and can improve the turn-on response.

### 10.2 Layout Example

**Figure 43. Layout Schematic (RGW Package)**

### 10.3 Power Dissipation

Knowing the device power dissipation and proper sizing of the thermal plane that is connected to the tab or pad is critical to avoiding thermal shutdown and ensuring reliable operation.

Power dissipation of the device depends on input voltage and load conditions, and can be calculated using Equation 5:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (5)$$

**Power Dissipation (continued)**

Power dissipation can be minimized and greater efficiency can be achieved by using the lowest possible input voltage necessary to achieve the required output voltage regulation.

On the VQFN (RGW) package, the primary conduction path for heat is through the exposed pad to the PCB. The pad can be connected to ground or left floating; however, the pad must be attached to an appropriate amount of copper PCB area to ensure the device does not overheat. On the DDPAK (KTW) package, the primary conduction path for heat is through the tab to the PCB. Connect that tab to ground. The maximum junction-to-ambient thermal resistance depends on the maximum ambient temperature, maximum device junction temperature, and power dissipation of the device and can be estimated using Equation 6:

$$R_{\theta JA} = \frac{(+125^{\circ}\text{C} - T_A)}{P_D} \tag{6}$$

Knowing the maximum  $R_{\theta JA}$ , the minimum amount of PCB copper area needed for appropriate heatsinking can be estimated using Figure 44.

Note:  $\theta_{JA}$  value at board size of 9 in<sup>2</sup> (that is, 3 in x 3 in) is a JEDEC standard.

**Figure 44.  $\theta_{JA}$  versus Board Size**

Figure 44 shows the variation of  $\theta_{JA}$  as a function of ground plane copper area in the board. Figure 44 is intended only as a guideline to demonstrate the affects of heat spreading in the ground plane; do not use Figure 44 to estimate actual thermal performance in real application environments.

**NOTE**

When the device is mounted on an application PCB, TI strongly recommends using  $\Psi_{JT}$  and  $\Psi_{JB}$ , as explained in the section.

**10.4 Thermal Considerations**

A better method of estimating the thermal measure comes from using the thermal metrics  $\Psi_{JT}$  and  $\Psi_{JB}$ , as shown in Thermal Information . These metrics are a more accurate representation of the heat transfer characteristics of the die and the package than  $R_{\theta JA}$ . The junction temperature can be estimated with the corresponding formulas given in Equation 7.

$$\Psi_{JT}: T_J = T_T + \Psi_{JT} \cdot P_D$$

$$\Psi_{JB}: T_J = T_B + \Psi_{JB} \cdot P_D$$

where

- $P_D$  is the power dissipation shown by Equation 5,
- $T_T$  is the temperature at the center-top of the IC package, and
- $T_B$  is the PCB temperature measured 1 mm away from the IC package on the PCB surface (see Figure 45).

(7)

**Thermal Considerations (continued)**

**NOTE**

Both  $T_T$  and  $T_B$  can be measured on actual application boards using a thermo-gun (an infrared thermometer).

For more information about measuring  $T_T$  and  $T_B$ , see the application note *Using New Thermal Metrics (SBVA025)*, available for download at [www.ti.com](http://www.ti.com).

(a) Example RGW (QFN) Package Measurement

(b) Example KTW (DDPAK) Package Measurement

- (1)  $T_T$  is measured at the center of both the X- and Y-dimensional axes.
- (2)  $T_B$  is measured **below** the package lead **on the PCB surface**.

**Figure 45. Measuring Points for  $T_T$  and  $T_B$**

Compared with  $\theta_{JA}$ , the thermal metrics  $\Psi_{JT}$  and  $\Psi_{JB}$  are less independent of board size, but do have a small dependency on board size and layout. Figure 46 shows characteristic performance of  $\Psi_{JT}$  and  $\Psi_{JB}$  versus board size.

Referring to Figure 46, the RGW package thermal performance has negligible dependency on board size. The KTW package, however, does have a measurable dependency on board size. This dependency exists because the package shape is not point symmetric to an IC center. In the KTW package, for example (see Figure 45), silicon is not beneath the measuring point of  $T_T$  which is the center of the X and Y dimension, so that  $\Psi_{JT}$  has a dependency. Also, because of that non-point symmetry, device heat distribution on the PCB is not point symmetric either, so that  $\Psi_{JB}$  has a greater dependency on board size and layout.

**Figure 46.  $\Psi_{JT}$  and  $\Psi_{JB}$  versus Board Size**

For a more detailed discussion of why TI does not recommend using  $\theta_{JC(top)}$  to determine thermal characteristics, refer to the application note *Using New Thermal Metrics* (SBVA025), available for download at [www.ti.com](http://www.ti.com). Also, refer to the application note *IC Package Thermal Metrics* (SPRA953) (also available on the TI website) for further information.

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Development Support

##### 11.1.1.1 Evaluation Modules

An evaluation module (EVM) is available to assist in the initial circuit performance evaluation using the TPS744. The [TPS74401EVM-118 evaluation module](#) (and [related user guide](#)) can be requested at the Texas Instruments website through the product folders or purchased directly from the [TI eStore](#).

##### 11.1.1.2 Spice Models

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. A SPICE model for the TPS744 is available through the product folders under *Tools & Software*.

### 11.2 Documentation Support

#### 11.2.1 Related Documentation

For related documentation see the following:

- Reference design. *6A Current-Sharing Dual LDO*. Literature number [TIDU421](#).
- Application report. *Using New Thermal Metrics*. Literature number [SBVA025](#).
- Application report. *IC Package Thermal Metrics*. Literature number [SPRA953](#).
- Application report. *Ultimate Regulation of with Fixed Output Versions of the TPS742xx, TPS743xx, and TPS744xx*. Literature number [SBVA024](#).
- TPS74401EVM-118 Evaluation Module User Guide. Literature number [SLVU143](#).

### 11.3 Trademarks

All trademarks are the property of their respective owners.

### 11.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

- (3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF TPS74401 :**

- Enhanced Product: [TPS74401-EP](#)

**NOTE: Qualified Version Definitions:**

- Enhanced Product - Supports Defense, Aerospace and Medical Applications

RGR (S-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

4210217/A 04/2009

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. QFN (Quad Flatpack No-Lead) package configuration.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
  - Pin 1 identifiers are located on both top and bottom of the package and within the zone indicated. The Pin 1 identifiers are either a molded, marked, or metal feature.

## KTW (R-PSFM-G7)

## PLASTIC FLANGE-MOUNT

4201284/A 08/01

- NOTES:
- All linear dimensions are in inches (millimeters).
  - This drawing is subject to change without notice.
  - Lead width and height dimensions apply to the plated lead.
  - Leads are not allowed above the Datum B.
  - Stand-off height is measured from lead tip with reference to Datum B.
  - Lead width dimension does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead width to exceed the maximum dimension by more than 0.003".
  - Cross-hatch indicates exposed metal surface.
  - Falls within JEDEC MO-169 with the exception of the dimensions indicated.

RGW (S-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5-1994.
  - This drawing is subject to change without notice.
  - Quad Flat pack, No-leads (QFN) package configuration
  - The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - Falls within JEDEC MO-220.

# THERMAL PAD MECHANICAL DATA

RGW (S-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

4206352-2/M 06/15

NOTE: All linear dimensions are in millimeters

RGW (S-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for solder mask tolerances.

## IMPORTANT NOTICE FOR TI DESIGN INFORMATION AND RESOURCES

Texas Instruments Incorporated ("TI") technical, application or other design advice, services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using any particular TI Resource in any way, you (individually or, if you are acting on behalf of a company, your company) agree to use it solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources.

You understand and agree that you remain responsible for using your independent analysis, evaluation and judgment in designing your applications and that you have full and exclusive responsibility to assure the safety of your applications and compliance of your applications (and of all TI products used in or for your applications) with all applicable regulations, laws and other applicable requirements. You represent that, with respect to your applications, you have all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. You agree that prior to using or distributing any applications that include TI products, you will thoroughly test such applications and the functionality of such TI products as used in such applications. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

You are authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING TI RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY YOU AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

You agree to fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of your non-compliance with the terms and provisions of this Notice.

This Notice applies to TI Resources. Additional terms apply to the use and purchase of certain types of materials, TI products and services. These include; without limitation, TI's standard terms for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>), [evaluation modules](#), and [samples](http://www.ti.com/sc/docs/sampterm.htm) (<http://www.ti.com/sc/docs/sampterm.htm>).
