150mA, Low-Dropout Regulator, Ultralow-Power, I_Q 1μA with Pin-Selectable, Dual-Level Output Voltage

FEATURES

- **Low I_Q: 1μA**
- **150mA, Low-Dropout Regulator with Pin-Selectable Dual Voltage Level Output**
- **Low Dropout: 200mV at 150mA**
- **3% Accuracy Over Load/Line/Temperature**
- **Available in Dual-Level, Fixed Output Voltages from 1.5V to 4.2V Using Innovative Factory EPROM Programming**
- **Available in an Adjustable Version from 1.22V to 5.25V or a Dual-Level Output Version**
- **V_{SET} Pin Toggles Output Voltage Between Two Factory-Programmed Voltage Levels**
- **Stable with a 1.0μF Ceramic Capacitor**
- **Thermal Shutdown and Overcurrent Protection**
- **CMOS Logic Level-Compatible Enable Pin**
- **Available in DDC (TSOT23-5) or DRV (2mm × 2mm SON-6) Package Options**

APPLICATIONS

- **TI MSP430 Attach Applications**
- **Power Rails with Programming Mode**
- **Dual Voltage Levels for Power-Saving Mode**
- **Wireless Handsets, Smartphones, PDAs, MP3 Players, and Other Battery-Operated Handheld Products**

DESCRIPTION

The TPS781 family of low-dropout (LDO) regulators offer the benefits of ultralow power (I_Q = 1μA), miniaturized packaging (2×2 SON-6), and selectable dual-level output voltage levels. An adjustable version is also available, but does not have the capability to shift voltage levels.

The V_{SET} pin allows the end user to switch between two voltage levels *on-the-fly* through a microprocessor-compatible input. This LDO is designed specifically for battery-powered applications where dual-level voltages are needed. With ultralow I_Q (1μA), microprocessors, memory cards, and smoke detectors are ideal applications for this device.

The ultralow-power and selectable dual-level output voltages allow designers to customize power consumption for specific applications. Designers can now shift to a lower voltage level in a battery-powered design when the microprocessor is in sleep mode, further reducing overall system power consumption. The two voltage levels are preset at the factory through a unique architecture using an EPROM. The EPROM technique allows for numerous output voltage options between V_{SET} low (1.5V to 4.2V) and V_{SET} high (2.0V to 3.0V) in the fixed output version only. Consult with your local factory representative for exact voltage options and ordering information; minimum order quantities may apply.

The TPS781 series are designed to be compatible with the TI MSP430 and other similar products. The enable pin is compatible with standard CMOS logic. This LDO is stable with any output capacitor greater than 1.0μF. Therefore, implementations of this device require minimal board space because of miniaturized packaging and a potentially small output capacitor. The TPS781 series I_Q (1μA) also come with thermal shutdown and current limit to protect the device during fault conditions. All packages have an operating temperature range of T_J = –40°C to +125°C. For high-performance applications requiring a dual-level voltage option, consider the TPS780 series, with an I_Q of 500nA and dynamic voltage scaling.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION[1][2]

PRODUCT	V_{OUT}
TPS781*vvvxxxyyyz*	**VVV** is the nominal output voltage for $V_{OUT(HIGH)}$ and corresponds to V_{SET} pin low. **XXX** is the nominal output voltage for $V_{OUT(LOW)}$ and corresponds to V_{SET} pin high. **YYY** is the package designator. **Z** is the tape and reel quantity (R = 3000, T = 250). Adjustable version[3][4]

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.
(2) Additional output voltage combinations are available on a quick-turn basis using innovative, factory EPROM programming. Minimum-order quantities apply; contact your sales representative for details and availability.
(3) To order the adjustable version, use *TPS78101YYYZ*.
(4) The device is either fixed voltage, dual-level V_{OUT}, or adjustable voltage only. Device design does not permit a fixed and adjustable output simultaneously.

ABSOLUTE MAXIMUM RATINGS[1]

At T_J = −40°C to +125°C, unless otherwise noted. All voltages are with respect to GND.

PARAMETER		TPS781 Series	UNIT
Input voltage range, V_{IN}		−0.3 to +6.0	V
Enable and V_{SET} voltage range, V_{EN} and V_{VSET}		−0.3 to V_{IN} + 0.3[2]	V
Output voltage range, V_{OUT}		−0.3 to V_{IN} + 0.3V	V
Maximum output current, I_{OUT}		Internally limited	
Output short-circuit duration		Indefinite	
Total continuous power dissipation, P_{DISS}		See the Dissipation Ratings table	
ESD rating	Human body model (HBM)	2	kV
	Charged device model (CDM)	500	V
Operating junction temperature range, T_J		−40 to +125	°C
Storage temperature range, T_{STG}		−55 to +150	°C

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
(2) V_{EN} and V_{VSET} absolute maximum rating are V_{IN} + 0.3V or +6.0V, whichever is less.

DISSIPATION RATINGS

BOARD	PACKAGE	$R_{\theta JC}$	$R_{\theta JA}$	DERATING FACTOR ABOVE T_A = +25°C	T_A < +25°C	T_A = +70°C	T_A = +85°C
High-K[1]	DRV	20°C/W	65°C/W	15.4mW/°C	1540mW	845mW	615mW
High-K[1]	DDC	90°C/W	200°C/W	5.0mW/°C	500mW	275mW	200mW

(1) The JEDEC high-K (2s2p) board used to derive this data was a 3-inch × 3-inch, multilayer board with 1-ounce internal power and ground planes and 2-ounce copper traces on top and bottom of the board.
ELECTRICAL CHARACTERISTICS

Over operating temperature range (T_J = −40°C to +125°C), V_{IN} = $V_{OUT(NOM)}$ + 0.5V or 2.2V, whichever is greater; I_{OUT} = 100μA, V_{VSET} = V_{EN} = V_{IN}, C_{OUT} = 1.0μF, fixed or adjustable, unless otherwise noted. Typical values at T_J = +25°C.

|	PARAMETER		TEST CONDITIONS		TPS781 Series			UNIT
					MIN	TYP	MAX	
V_{IN}	Input voltage range				2.2		5.5	V
V_{OUT}[1]	DC output accuracy	Nominal	T_J = +25°C, V_{SET} = high/low		−2	±1	+2	%
		Over V_{IN}, I_{OUT}, temperature	V_{OUT} + 0.5V ≤ V_{IN} ≤ 5.5V, 0mA ≤ I_{OUT} ≤ 150mA, V_{SET} = high/low		−3.0	±2.0	+3.0	%

				f = 100Hz		20		dB
				f = 1kHz		15		dB
$t_{TR(H \to L)}$	V_{OUT} transition time (high-to-low) V_{OUT} = 97% × $V_{OUT(HIGH)}$		V_{OUT_LOW} = 2.2V, $V_{OUT(HIGH)}$ = 3.3V, I_{OUT} = 10mA			800		μs
$t_{TR(L \to H)}$	V_{OUT} transition time (low-to-high) V_{OUT} = 97% × $V_{OUT(LOW)}$		V_{OUT_HIGH} = 3.3V, $V_{OUT(LOW)}$ = 2.2V, I_{OUT} = 10mA			800		μs
t_{STR}	Startup time[7]		C_{OUT} = 1.0μF, V_{OUT} = 10% $V_{OUT(NOM)}$ to V_{OUT} = 90% $V_{OUT(NOM)}$			500		μs
t_{SHDN}	Shutdown time[8]		I_{OUT} = 150mA, C_{OUT} = 1.0μF, V_{OUT} = 2.8V, V_{OUT} = 90% $V_{OUT(NOM)}$ to V_{OUT} = 10% $V_{OUT(NOM)}$			500[9]		μs
T_{SD}	Thermal shutdown temperature		Shutdown, temperature increasing			+160		°C
			Reset, temperature decreasing			+140		°C
T_J	Operating junction temperature				−40		+125	°C

(1) The output voltage for V_{SET} = low/high is programmed at the factory.
(2) Adjustable version only.
(3) No V_{SET} pin on the adjustable version.
(4) No dynamic voltage scaling on the adjustable version.
(5) V_{DO} is not measured for devices with $V_{OUT(NOM)}$ < 2.3V because minimum V_{IN} = 2.2V.
(6) The TPS78101 FB pin is tied to V_{OUT}. Adjustable version only.
(7) Time from V_{EN} = 1.2V to V_{OUT} = 90% ($V_{OUT(NOM)}$).
(8) Time from V_{EN} = 0.4V to V_{OUT} = 10% ($V_{OUT(NOM)}$).
(9) See *Shutdown* in the *Application Information* section for more details.

Table 1. TERMINAL FUNCTIONS

TERMINAL			
NAME	DRV	DDC	DESCRIPTION
OUT	1	5	Regulated output voltage pin. A small (1μF) ceramic capacitor is needed from this pin to ground to assure stability. See the *Input and Output Capacitor Requirements* in the Application Information section for more details.
N/C	2	—	Not connected.
V_{SET}/FB	3	4	Feedback pin (FB) for adjustable versions; V_{SET} for fixed voltage versions. Driving the select pin (V_{SET}) below 0.4V selects preset output voltage high. Driving the V_{SET} pin over 1.2V selects preset output voltage low.
EN	4	3	Driving the enable pin (EN) over 1.2V turns on the regulator. Driving this pin below 0.4V puts the regulator into shutdown mode, reducing operating current to 18nA typical.
GND	5	2	Ground pin.
IN	6	1	Input pin. A small capacitor is needed from this pin to ground to assure stability. Typical input capacitor = 1.0μF. Both input and output capacitor grounds should be tied back to the IC ground with no significant impedance between them.
Thermal pad	Thermal pad	—	It is recommended that the SON package thermal pad be connected to ground.

TYPICAL CHARACTERISTICS

Over the operating temperature range of $T_J = -40°C$ to $+125°C$, $V_{IN} = V_{OUT(TYP)} + 0.5V$ or $2.2V$, whichever is greater; $I_{OUT} = 100µA$, $V_{EN} = V_{VSET} = V_{IN}$, $C_{OUT} = 1µF$, and $C_{IN} = 1µF$, unless otherwise noted.

APPLICATION INFORMATION

APPLICATION EXAMPLES

The TPS781 series of LDOs typically take less than 800µs to transition from a lower voltage of 2.2V to a higher voltage of 3.3V under an output load of 150mA; see Figure 45. Additionally, the TPS781 series contain active pull-down circuitry that automatically pulls charge out of the voltage capacitor to transition the output voltage from the higher voltage to the lower voltage, even with no load connected. Output voltage overshoots and undershoots are minimal under this load condition. The TPS781 series typically take less than 800µs to transition from V_{SET} low (3.3V to 2.2V), or V_{SET} high (2.2V to 3.3V); see Figure 45 and Figure 46. Both output states of the TPS781 series are factory-programmable between 1.5V to 4.2V. Note that during startup or steady-state conditions, it is important that the EN pin and V_{SET} pin voltages never exceed V_{IN} + 0.3V.

Figure 48. Typical Application Circuit

The TPS781 series is also used effectively in dynamic voltage scaling (DVS) applications. DVS applications are required to dynamically switch between a high operational voltage to a low standby voltage in order to reduce power consumption. Modern multimillion gate microprocessors fabricated with the latest sub-micron processes save power by transitioning to a lower voltage to reduce leakage currents while maintaining content. This architecture enables the microprocessor to transition quickly into an operational state (wake up) without requiring a reload of the states from external memory, or a reboot.

Programming the TPS78101 Adjustable LDO Regulator

The output voltage of the TPS78101 adjustable regulator is programmed using an external resistor divider as shown in Figure 49. The output voltage operating range is 1.2V to 5.1V, and is calculated using Equation 1:

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R_1}{R_2}\right)$$

(1)

Where:

V_{FB} = 1.216V typ (the internal reference voltage)

Resistors R_1 and R_2 should be chosen for approximately 1.2µA divider current. Lower value resistors can be used for improved noise performance, but the solution consumes more power. Higher resistor values should be avoided as leakage current into/out of FB across R_1/R_2 creates an offset voltage that artificially increases/decreases the feedback voltage and thus erroneously decreases/increases V_{OUT}. Table 2 lists several common output voltages and resistor values. The recommended design procedure is to choose R_2 = 1MΩ to set the divider current at 1.2µA, and then calculate R_1 using Equation 2:

$$R_1 = \left(\frac{V_{OUT}}{V_{FB}} - 1\right) \times R_2$$

(2)

**Figure 49. TPS78101 Adjustable LDO Regulator Programming**

Table 2. Output Voltage Programming Guide

OUTPUT VOLTAGE	R_1	R_2
1.8V	0.499MΩ	1MΩ
2.8V	1.33MΩ	1MΩ
5.0V	3.16MΩ	1MΩ

Powering the MSP430 Microcontroller

Several versions of the TPS781 are ideal for powering the MSP430 microcontroller. Table 3 shows potential applications of some voltage versions.

Table 3. Typical MSP430 Applications

DEVICE	$V_{OUT(HIGH)}$ (TYP)	$V_{OUT(LOW)}$ (TYP)	APPLICATION
TPS781360200	3.6V	2.0V	$V_{OUT, MIN}$ > 1.800V required by many MSP430s. Allows lowest power consumption operation.
TPS781360220	3.6V	2.2V	$V_{OUT, MIN}$ > 2.200V required by some MSP430s FLASH operation.
TPS781360300	3.6V	3.0V	$V_{OUT, MIN}$ > 2.700V required by some MSP430s FLASH operation.
TPS781360220	3.6V	2.2V	$V_{OUT, MIN}$ < 3.600V required by some MSP430s. Allows highest speed operation.

The TPS781 family offers many output voltage versions to allow designers to optimize the supply voltage for the processing speed required of the MSP430. This flexible architecture minimizes the supply current consumed by the particular MSP430 application. The MSP430 total system power can be reduced by substituting the 1µA I_Q TPS781 series LDO in place of an existing, older-technology LDO. Additionally, DVS allows for increasing the clock speed in active mode (MSP430 V_{CC} = 3.6V). The 3.6V V_{CC} reduces the MSP430 time in active mode. In low-power mode, MSP430 system power can be further reduced by lowering the MSP430 V_{CC} to 2.2V in sleep mode.

Key features of the TPS781 series are an ultralow quiescent current (1µA), DVS, and miniaturized packaging. The TPS781 family are available in SON-6 and TSOT-23 packages. Figure 50 shows a typical MSP430 circuit powered by an LDO without DVS. Figure 51 is an MSP430 circuit using a TPS781 LDO that incorporates an integrated DVS, thus simplifying the circuit design. In a circuit without DVS, as Figure 50 illustrates, V_{CC} is always at 3.0V. When the MSP430 goes into sleep mode, V_{CC} remains at 3.0V; if DVS is applied, V_{CC} could be reduced in sleep mode. In Figure 51, the TPS781 LDO with integrated DVS maintains 3.6V V_{CC} until a logic high signal from the MSP430 forces V_{OUT} to level shift V_{OUT} from 3.6V down to 2.2V; thus reducing power in sleep mode.

Figure 50. Typical LDO without DVS

Figure 51. TPS781 with Integrated DVS

The other benefit of DVS is that it allows a higher V_{CC} voltage on the MSP430, increasing the clock speed and reducing the active mode dwell time.

INPUT AND OUTPUT CAPACITOR REQUIREMENTS

Although an input capacitor is not required for stability, it is good analog design practice to connect a 0.1μF to 1.0μF low equivalent series resistance (ESR) capacitor across the input supply near the regulator. This capacitor counteracts reactive input sources and improves transient response, noise rejection, and ripple rejection. A higher-value capacitor may be necessary if large, fast rise-time load transients are anticipated, or if the device is not located near the power source. If source impedance is not sufficiently low, a 0.1μF input capacitor may be necessary to ensure stability.

The TPS781 series are designed to be stable with standard ceramic capacitors with values of 1.0μF or larger at the output. X5R- and X7R-type capacitors are best because they have minimal variation in value and ESR over temperature. Maximum ESR should be less than 1.0Ω. With tolerance and dc bias effects, the minimum capacitance to ensure stability is 1μF.

BOARD LAYOUT RECOMMENDATIONS TO IMPROVE PSRR AND NOISE PERFORMANCE

To improve ac performance (such as PSRR, output noise, and transient response), it is recommended that the printed circuit board (PCB) be designed with separate ground planes for V_{IN} and V_{OUT}, with each ground plane connected only at the GND pin of the device. In addition, the ground connection for the output capacitor should connect directly to the GND pin of the device. High ESR capacitors may degrade PSRR.

INTERNAL CURRENT LIMIT

The TPS781 is internally current-limited to protect the regulator during fault conditions. During current limit, the output sources a fixed amount of current that is largely independent of output voltage. For reliable operation, the device should not be operated in a current limit state for extended periods of time.

The PMOS pass element in the TPS781 series has a built-in body diode that conducts current when the voltage at OUT exceeds the voltage at IN. This current is not limited, so if extended reverse voltage operation is anticipated, external limiting to 5% of rated output current may be appropriate.

SHUTDOWN

The enable pin (EN) is active high and is compatible with standard and low-voltage CMOS levels. When shutdown capability is not required, EN should be connected to the IN pin, as shown in Figure 52. Figure 53 shows both EN and V_{SET} connected to IN. The TPS781 series, with internal active output pull-down circuitry, discharges the output to within 5% V_{OUT} with a time (*t*) shown in Equation 3:

$$t = 3 \left[\frac{10k\Omega \times R_L}{10k\Omega + R_L} \right] \times C_{OUT}$$

(3)

Where:

 R_L = output load resistance
   C_{OUT} = output capacitance

Figure 52. Circuit Showing EN Tied High when Shutdown Capability is Not Required

Figure 53. Circuit to Tie Both EN and V_{SET} High

DROPOUT VOLTAGE

The TPS781 series use a PMOS pass transistor to achieve low dropout. When (V_{IN} − V_{OUT}) is less than the dropout voltage (V_{DO}), the PMOS pass device is the linear region of operation and the input-to-output resistance is the $R_{DS(ON)}$ of the PMOS pass element. V_{DO} approximately scales with output current because the PMOS device behaves like a resistor in dropout. As with any linear regulator, PSRR and transient response are degraded as (V_{IN} − V_{OUT}) approaches dropout. This effect is shown in the Typical Characteristics section. Refer to application report SLVA207, *Understanding LDO Dropout*, available for download from www.ti.com.

TRANSIENT RESPONSE

As with any regulator, increasing the size of the output capacitor reduces over/undershoot magnitude but increases duration of the transient response. For more information, see Figure 42.

ACTIVE V_{OUT} PULL-DOWN

In the TPS781 series, the active pull-down discharges V_{OUT} when the device is off. However, the input voltage must be greater than 2.2V for the active pull-down to work.

MINIMUM LOAD

The TPS781 series are stable with no output load. Traditional PMOS LDO regulators suffer from lower loop gain at very light output loads. The TPS781 employs an innovative, low-current circuit under very light or no-load conditions, resulting in improved output voltage regulation performance down to zero output current. See Figure 41 for the load transient response.

THERMAL INFORMATION

THERMAL PROTECTION

Thermal protection disables the output when the junction temperature rises to approximately +160°C, allowing the device to cool. Once the junction temperature cools to approximately +140°C, the output circuitry is enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off again. This cycling limits the dissipation of the regulator, protecting it from damage as a result of overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heatsink. For reliable operation, junction temperature should be limited to +125°C maximum. To estimate the margin of safety in a complete design (including heatsink), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection should trigger at least +35°C above the maximum expected ambient condition of your particular application. This configuration produces a worst-case junction temperature of +125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS781 series has been designed to protect against overload conditions. However, it is not intended to replace proper heatsinking. Continuously running the TPS781 series into thermal shutdown degrades device reliability.

POWER DISSIPATION

The ability to remove heat from the die is different for each package type, presenting different considerations in the PCB layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air. Performance data for JEDEC low- and high-K boards are given in the Dissipation Ratings table. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves the heatsink effectiveness. Power dissipation depends on input voltage and load conditions. Power dissipation (P_D) is equal to the product of the output current times the voltage drop across the output pass element (V_{IN} to V_{OUT}), as shown in Equation 4:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \tag{4}$$

PACKAGE MOUNTING

Solder pad footprint recommendations for the TPS781 series are available from the Texas Instruments web site at www.ti.com through the TPS781 series product folders.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

DRV (S-PWSON-N6)   PLASTIC SMALL OUTLINE NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

NOTES: A. All linear dimensions are in millimeters.
        B. This drawing is subject to change without notice.
        C. Publication IPC−7351 is recommended for alternate designs.
        D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note,
            QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets
            for specific thermal information, via requirements, and recommended board layout.
            These documents are available at www.ti.com <http://www.ti.com>.
        E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should
            contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
        F. Customers should contact their board fabrication site for solder mask tolerances.
