SLVSBF8C - MARCH 2013 - REVISED MAY 2015

TPS8269x High-Efficiency MicroSIP™ Step-Down Converter (Profile <1mm)

Technical

Documents

1 Features

- Total Solution Size <6.7 mm²
- 95% Efficiency at 3MHz Operation
- 23µA Quiescent Current
- High Duty-Cycle Operation
- Best in Class Load and Line Transient
- ±2% Total DC Voltage Accuracy
- Automatic PFM/PWM Mode Switching
- Low Ripple Light-Load PFM Mode
- Excellent AC Load Regulation
- Internal Soft Start, 200-µs Start-Up Time
- Integrated Active Power-Down Sequencing (Optional)
- Current Overload and Thermal Shutdown
 Protection
- Sub 1-mm Profile Solution

2 Applications

- Cell Phones, Smart-Phones
- Optical Data Modules
- Camera and Sensor Modules
- Wearable Devices
- LDO Replacement

3 Description

Tools &

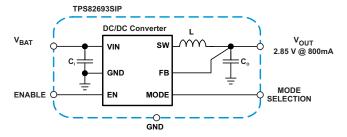

Software

The TPS8269xSIP device is a complete 500mA / 800mA, DC/DC step-down power supply intended for low-power applications. Included in the package are the switching regulator, inductor and input/output capacitors. No additional components are required to finish the design. The TPS8269xSIP is based on a high-frequency synchronous step-down dc-dc converter optimized for battery-powered portable applications. The MicroSIP™ DC/DC converter operates at a regulated 3-MHz switching frequency and enters the power-save mode operation at light load currents to maintain high efficiency over the entire load current range. The PFM mode extends the battery life by reducing the quiescent current to 23µA (typ) during light load operation. For noise-sensitive applications, the device has PWM spread spectrum capability providing a lower noise regulated output, as well as low noise at the input. These features, combined with high PSRR and AC load regulation performance, make this device suitable to replace a linear regulator to obtain better power conversion efficiency. The TPS8269xSIP is packaged in a compact (2.3mm x 2.9mm) and low profile (1.0mm) BGA package suitable for automated assembly by standard surface mount equipment.

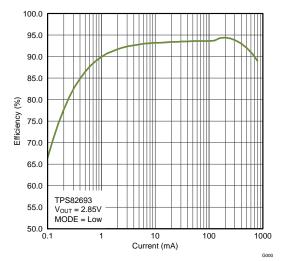

Device Information

ORDER NUMBER	PACKAGE	BODY SIZE
TPS82692SIP	μSIP (8)	2,9mm × 2,3mm
TPS82693SIP	μSIP (8)	2,9mm × 2,3mm
TPS826951SIP	μSIP (8)	2,9mm × 2,3mm
TPS82697SIP	μSIP (8)	2,9mm × 2,3mm
TPS82698SIP	μSIP (8)	2,9mm × 2,3mm

5 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Cł	nanges from Revision B (March 2014) to Revision C	Page
•	Added text to Device Comparison table for the TPS826951 device special features	4
•	Moved T _{stg} spec from Handling Ratings to Absolute Maximum Ratings table	5
•	Changed Handling Ratings table to ESD Ratings table	5

Changes from Revision A (July 2013) to Revision B

•	Global format to new data sheet standard	. 1
•	Changed TPS82692, TPS826951 devices to production status.	. 4
•	Changed Ordering Information table to "Device Comparison" table with cross reference to the POA at end of document.	. 4
•	Moved Abs Max Ratings, Handling Ratings, Rec Oper Conditions, Thermal Info, and Elec Charactistics tables to the Specifications section	. 5
•	Deleted Regulated DC Output Voltage parameters to electrical characteristics table for device TPS82692	7
•	Added efficiency graphs for device TPS82692	11

3

Changes from Original (March 2013) to Revision APage•Added Regulated DC Output Voltage parameters to electrical characteristics table for device TPS826977•Added Regulated DC Output Voltage parameters to electrical characteristics table for device TPS8269517•Added Regulated DC Output Voltage parameters to electrical characteristics table for device TPS8269517•Added Regulated DC Output Voltage parameters to electrical characteristics table for device TPS826987•Added Power-save mode ripple voltage to electrical characteristics table for devices TPS826951, TPS82697, TPS826988•Added Start-up time to electrical characteristics table for devices TPS826951, TPS826988•Added Efficiency vs Load Current Graph figure references to Table of Graphs.9•Added Transient Response Plots to Typical Characteristics for devices TPS826951, TPS826951, TPS8269814•Added AC Load Transient Response Plots to Typical Characteristics for devices TPS826951, TPS8269814

PART NUMBER OUTPUT VOLTAGE		SPECIFIC FEATURE	STATUS		
TPS82692	2.2V	800mA peak output current, spread spectrum frequency modulation	Production		
TPS82693	2.85V	800mA peak output current, spread spectrum frequency modulation, output discharge	Production		
TPS826951	2.5V	800mA peak output current, spread spectrum frequency modulation, output discharge	Production		
TPS82697	2.8V	800mA peak output current	Production		
TPS82698	3.0V	800mA peak output current, spread spectrum frequency modulation, output discharge	Production		

Table 1. Device Comparison

6 Terminal Configuration and Functions

8-Bump µSIP Package

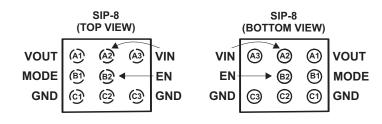

Table 2. Terminal Functions

TERMINAL		1/0	DECODIDION	
NAME	NO.	I/O	DESCRIPTION	
VOUT	A1	0	Power output terminal. Apply output load between this terminal and GND.	
VIN	A2, A3	Ι	The VIN terminals supply current to the TPS8269xSIP's internal regulator.	
EN	B2	I	This is the enable terminal of the device. Connecting this terminal to ground forces the converter into shutdown mode. Pulling this terminal to $V_{\rm IN}$ enables the device. This terminal must not be left floating and must be terminated.	
			This is the mode selection terminal of the device. This terminal must not be left floating and must be terminated.	
MODE	E B1	B1 I	MODE = LOW: The device is operating in regulated frequency pulse width modulation mode (PWM) at high-load currents and in pulse frequency modulation mode (PFM) at light load currents.	
				MODE = HIGH: Low-noise mode enabled, regulated frequency PWM operation forced.
GND	C1, C2, C3	-	Ground terminal.	

4

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

			MIN	MAX	UNIT
	Voltage at VIN ⁽²⁾⁽³⁾ , SW ⁽³⁾		-0.3	6	V
Input Voltage	Voltage at VOUT ⁽³⁾		-0.3	3.6	V
	Voltage at EN, MODE (3)		-0.3	V _{IN} + 0.3	V
Peak output current, I _O ⁽⁴⁾		TPS82692, TPS82693, TPS826951, TPS826957, TPS62698		800 ⁽⁴⁾	mA
Power dissipation	Power dissipation			Internally limite	d
Dperating temperature range, T _A ⁽⁵⁾			-40	85	°C
Maximum internal operating temperature, T _{INT(max)}				125	°C
Storage temperature, T _{stg}			-55	125	C

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) Operation above 4.8 V input voltage is not recommended over an extended period of time.

(3) All voltage values are with respect to network ground terminal.

(4) Limit to 50% Duty Cycle over Lifetime.

(5) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T_{A(max)}) is dependent on the maximum operating junction temperature (T_{J(max)}), the maximum power dissipation of the device in the application (P_{D(max)}), and the junction-to-ambient thermal resistance of the part/package in the application (θ_{JA}), as given by the following equation: T_{A(max)} = T_{J(max)} – (θ_{JA} X P_{D(max)}). To achieve optimum performance, it is recommended to operate the device with a maximum junction temperature of 105°C.

7.2 ESD Ratings

		VALUE	UNIT
ESD	Human body model (HBM)	±2000	V
ESD	Charged device model (CDM)	±1000	V

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V _{IN}	Input voltage range		2.3		4.8 ⁽¹⁾	V
Io	Output current range	TPS82692, TPS82693 TPS826951 TPS82697, TPS82698			800	mA
	Additional output capacitance (PFM/PWM)			0	4	μF
	Additional output capacitance (PWM)			0	7	μF
T _A	Ambient temperature		-40		+85	°C
TJ	Operating junction temperature		-40		+125	°C

(1) Operation above 4.8 V input voltage is not recommended over an extended period of time.

9.1 Overview

The TPS8269xSIP is a standalone synchronous step-down converter operating at a regulated 3-MHz frequency pulse width modulation (PWM) at moderate to heavy load currents (up to 500mA / 800mA output current). At light load currents, the TPS8269xSIP's converter operates in power-save mode with pulse frequency modulation (PFM).

The converter uses a unique frequency locked ring oscillating modulator to achieve *best-in-class* load and line response. One key advantage of the non-linear architecture is that there is no traditional feed-back loop. The loop response to change in V_0 is essentially instantaneous, which explains the transient response. Although this type of operation normally results in a switching frequency that varies with input voltage and load current, an internal frequency lock loop (FLL) holds the switching frequency constant over a large range of operating conditions.

Combined with *best in class* load and line transient response characteristics, the low quiescent current of the device (ca. 23µA) allows to maintain high efficiency at light load, while preserving fast transient response for applications requiring tight output regulation.

The TPS8269xSIP integrates an input current limit to protect the device against heavy load or short circuits and features an undervoltage lockout circuit to prevent the device from misoperation at low input voltages.

9.2 Functional Block Diagram

TEXAS INSTRUMENTS

www.ti.com

9.3 Feature Description

9.3.1 Power-Save Mode

If the load current decreases, the converter will enter Power Save Mode operation automatically. During powersave mode the converter operates in discontinuous current (DCM) with a minimum of one pulse, which produces low output ripple compared with other PFM architectures.

When in power-save mode, the converter resumes its operation when the output voltage trips below the nominal voltage. It ramps up the output voltage with a minimum of one pulse and goes into power-save mode when the output voltage is within its regulation limits again.

PFM mode is left and PWM operation is entered as the output current can no longer be supported in PFM mode. As a consequence, the DC output voltage is typically positioned ca. 1.5% above the nominal output voltage and the transition between PFM and PWM is seamless.

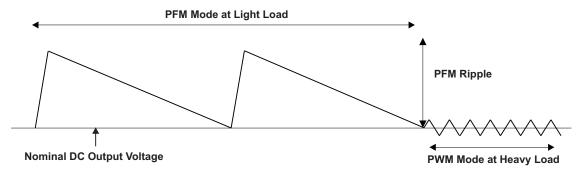

Figure 44. Operation In PFM Mode And Transfer To PWM Mode

9.3.2 Mode Selection

The MODE terminal allows to select the operating mode of the device. Connecting this terminal to GND enables the automatic PWM and power-save mode operation. The converter operates in regulated frequency PWM mode at moderate to heavy loads and in the PFM mode during light loads, which maintains high efficiency over a wide load current range.

Pulling the MODE terminal high forces the converter to operate in the PWM mode even at light load currents. The advantage is that the converter operates with a fixed frequency that allows simple filtering of the switching frequency for noise-sensitive applications. In this mode, the efficiency is lower compared to the power-save mode during light loads.

For additional flexibility, it is possible to switch from power-save mode to PWM mode during operation. This allows efficient power management by adjusting the operation of the converter to the specific system requirements.

9.3.3 Soft Start

The TPS8269xSIP has an internal soft-start circuit that limits the inrush current during start-up. This limits input voltage drops when a battery or a high-impedance power source is connected to the input of the MicroSIPTM converter.

The soft-start system progressively increases the switching on-time from a minimum pulse-width of 35ns as a function of the output voltage. This mode of operation continues for approximately 100µs after enable. Should the output voltage not have reached its target value by that time, such as in the case of heavy load, the soft-start transitions to a second mode of operation.

If the output voltage has raised above 0.5V (approximately), the converter increases the input current limit thereby enabling the power supply to come-up properly. The start-up time mainly depends on the capacitance present at the output node and load current.

18 Submit Documentation Feedback

9.4 Device Functional Modes

9.4.1 Low Dropout, 100% Duty Cycle Operation

The device starts to enter 100% duty cycle mode once input and output voltage come close together. In order to maintain the output voltage, the DC/DC converter's high-side MOSFET is turned on 100% for one or more cycles.

With further decreasing V_{IN} the high-side switch is constantly turned on, thereby providing a low input-to-output voltage difference. This is particularly useful in battery-powered applications to achieve longest operation time by taking full advantage of the whole battery voltage range.

9.4.2 Enable

The TPS8269xSIP device starts operation when EN is set high and starts up with the soft start as previously described. For proper operation, the EN terminal must be terminated and must not be left floating.

Pulling the EN terminal low forces the device into shutdown. In this mode, all internal circuits are turned off and V_{IN} current reduces to the device leakage current, typically a few hundred nano amps.

The TPS8269xSIP device can actively discharge the output capacitor when it turns off (See *Device Comparison* table). The integrated discharge resistor has a typical resistance of 100 Ω . The required time to ramp-down the output voltage depends on the load current and the capacitance present at the output node.

10 Applications and Implementation

10.1 Application Information

The TPS8269X devices are complete power supplies, optimized for and working within the given specification range without additional components or design steps. Further improvements can be achieved as described below.

10.2 Typical Application

10.2.1 Input Capacitor Selection

Because of the pulsating input current nature of the buck converter, a low ESR input capacitor is required to prevent large voltage transients that can cause misbehavior of the device or interference in other circuits in the system.

For most applications, the input capacitor that is integrated into the TPS8269x should be sufficient. If the application exhibits a noisy or erratic switching frequency, experiment with additional input ceramic capacitance to find a remedy.

The TPS8269x uses a tiny ceramic input capacitor. When a ceramic capacitor is combined with trace or cable inductance, such as from a wall adapter, a load step at the output can induce ringing at the VIN terminal. This ringing can couple to the output and be mistaken as loop instability or can even damage the part. In this circumstance, additional "bulk" capacitance, such as electrolytic or tantalum, should be placed between the input of the converter and the power source lead to reduce ringing that can occur between the inductance of the power source leads and C_{l} .

10.2.2 Output Capacitor Selection

The advanced, fast-response, voltage mode, control scheme of the TPS8269x allows the use of a tiny ceramic output capacitor (C_0). For most applications, the output capacitor integrated in the TPS8269x is sufficient.

At nominal load current, the device operates in PWM mode; the overall output voltage ripple is the sum of the voltage step that is caused by the output capacitor ESL and the ripple current that flows through the output capacitor impedance. At light loads, the output capacitor limits the output ripple voltage and provides holdup during large load transitions.

The TPS8269x is designed as a Point-Of-Load (POL) regulator, to operate stand-alone without requiring any additional capacitance. Adding a 4.7µF ceramic output capacitor (X7R or X5R dielectric) generally works from a converter stability point of view, helps to minimize the output ripple voltage in PFM mode and improves the converter's transient response under when input and output voltage are close together.

For best operation (i.e. optimum efficiency over the entire load current range, proper PFM/PWM auto transition), the TPS8269xSIP requires a minimum output ripple voltage in PFM mode. The typical output voltage ripple is ca. 1% of the nominal output voltage V_0 . The PFM pulses are time controlled resulting in a PFM output voltage ripple and PFM frequency that depends (first order) on the capacitance seen at the MicroSiPTM DC/DC converter's output.

In applications requiring additional output bypass capacitors located close to the load, care should be taken to ensure proper operation. If the converter exhibits marginal stability or erratic switching frequency, experiment with additional low value series resistance (e.g. 50 to $100m\Omega$) in the output path to find a remedy.

Because the damping factor in the output path is directly related to several resistive parameters (e.g. inductor DCR, power-stage $r_{DS(on)}$, PWB DC resistance, load switches $r_{DS(on)}$...) that are temperature dependant, the converter small and large signal behavior must be checked over the input voltage range, load current range and temperature range.

The easiest sanity test is to evaluate, directly at the converter's output, the following aspects:

- PFM/PWM efficiency
- PFM/PWM and forced PWM load transient response

During the recovery time from a load transient, the output voltage can be monitored for settling time, overshoot or ringing that helps judge the converter's stability. Without any ringing, the loop has usually more than 45° of phase margin.

11 Power Supply Recommendations

The TPS8269X MicroSIPTM devices are fully featured point of load power supplies. Please use information given in *Application Information* to connect input and output circuitry appropriately. Even if electrical characteristics are based on measurements up to V_{IN} =5.5V, it is not recommended to operate at higher voltages than 4.8V permanently.

12 Layout

12.1 Layout Guidelines

In making the pad size for the SiP LGA balls, it is recommended that the layout use non-solder-mask defined (NSMD) land. With this method, the solder mask opening is made larger than the desired land area, and the opening size is defined by the copper pad width. Figure 45 shows the appropriate diameters for a MicroSiPTM layout.

12.2 Layout Example

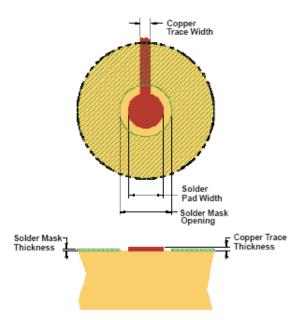

Figure 45. Recommended Land Pattern Image And Dimensions

SOLDER PAD DEFINITIONS ⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾	COPPER PAD	SOLDER MASK ⁽⁵⁾ OPENING	COPPER THICKNESS	STENCIL ⁽⁶⁾ OPENING	STENCIL THICKNESS	
Non-solder-mask defined (NSMD)	0.30mm	0.360mm	1oz max (0.032mm)	0.34mm diameter	0.1mm thick	

(1) Circuit traces from non-solder-mask defined PWB lands should be 75µm to 100µm wide in the exposed area inside the solder mask opening. Wider trace widths reduce device stand off and affect reliability.

(2) Best reliability results are achieved when the PWB laminate glass transition temperature is above the operating the range of the intended application.

(3) Recommend solder paste is Type 3 or Type 4.

(4) For a PWB using a Ni/Au surface finish, the gold thickness should be less than 0.5mm to avoid a reduction in thermal fatigue performance.

(5) Solder mask thickness should be less than 20 µm on top of the copper circuit pattern.

(6) For best solder stencil performance use laser cut stencils with electro polishing. Chemically etched stencils give inferior solder paste volume control.

12.3 Surface Mount Information

The TPS8269x MicroSIP[™] DC/DC converter uses an open frame construction that is designed for a fully automated assembly process and that features a large surface area for pick and place operations. See the "Pick Area" in the package drawings.

Package height and weight have been kept to a minimum thereby allowing the MicroSIP[™] device to be handled similarly to a 0805 component.

See JEDEC/IPC standard J-STD-20b for reflow recommendations.

22 Submit Documentation Feedback

12.4 Thermal And Reliability Information

The TPS8269x output current may need to be de-rated if it is required to operate in a high ambient temperature or deliver a large amount of continuous power. The amount of current de-rating is dependent upon the input voltage, output power and environmental thermal conditions. Care should especially be taken in applications where the localized PWB temperature exceeds 65°C.

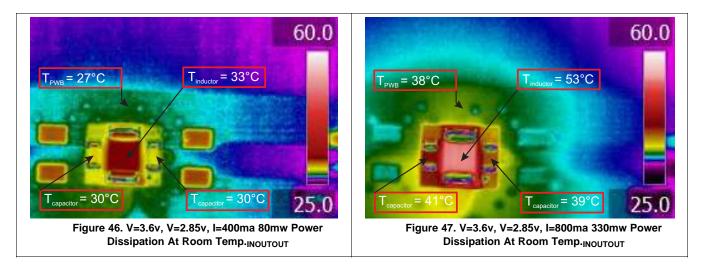

The TPS8269x die and inductor temperature should be kept lower than the maximum rating of 125°C, so care should be taken in the circuit layout to ensure good heat sinking. Sufficient cooling should be provided to ensure reliable operation.

Three basic approaches for enhancing thermal performance are listed below:

- Improve the power dissipation capability of the PCB design.
- Improve the thermal coupling of the component to the PCB.
- Introduce airflow into the system.

To estimate the junction temperature, approximate the power dissipation within the TPS8269x by applying the typical efficiency stated in this datasheet to the desired output power; or, by taking a power measurement if you have an actual TPS8269x device or a TPS8269x evaluation module. Then calculate the internal temperature rise of the TPS8269x above the surface of the printed circuit board by multiplying the TPS8269x power dissipation by the thermal resistance.

The thermal resistance numbers listed in the Thermal Information table are based on modeling the MicroSIP[™] package mounted on a high-K test board specified per JEDEC standard. For increased accuracy and fidelity to the actual application, it is recommended to run a thermal image analysis of the actual system. Figure 46 and Figure 47 are thermal images of TI's evaluation board with readings of the temperatures at specific locations on the device.

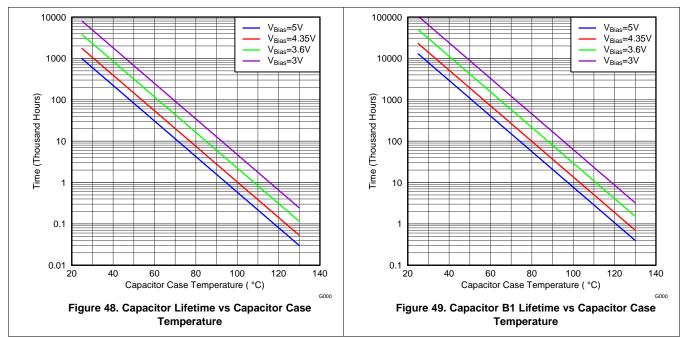

The TPS8269x is equipped with a thermal shutdown that will inhibit power switching at high junction temperatures. The activation threshold of this function, however, is above 125°C to avoid interfering with normal operation. Thus, it follows that prolonged or repetitive operation under a condition in which the thermal shutdown activates necessarily means that the components internal to the MicroSIPTM package are subjected to high temperatures for prolonged or repetitive intervals, which may damage or impair the reliability of the device.

MLCC capacitor reliability/lifetime is depending on temperature and applied voltage conditions. At higher temperatures, MLCC capacitors are subject to stronger stress. On the basis of frequently evaluated failure rates determined at standardized test conditions, the reliability of all MLCC capacitors can be calculated for their actual operating temperature and voltage.

Copyright © 2013–2015, Texas Instruments Incorporated

Thermal And Reliability Information (continued)

Failures caused by systematic degradation can be described by the Arrhenius model. The most critical parameter (IR) is the Insulation Resistance (i.e. leakage current). The drop of IR below a lower limit (e.g. 1 M Ω) is used as the failure criterion, see Figure 48. Figure 49 (B1 life) defines the capacitor lifetime based on a failure rate reaching 1%. It should be noted that the wear-out mechanisms occurring in the MLCC capacitors are not reversible but cumulative over time.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

PACKAGE OPTION ADDENDUM

21-Jan-2017

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above. Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's noncompliance with the terms and provisions of this Notice.
